Canadian Statistical Review

Data in this publication were retrieved from CANSIM® (Registered Trade Mark of Statistics Canada for its Canadian Socio-Economic Information Management System), and processed to create a photo-ready copy from which this publication was produced. CANSIM is the Statistics Canada computerized data bank; series published in this Review (as well as other data) are available on computer printouts, cards, tape or directly via terminal.

The identification numbers at the top of each column of data refer to the unadjusted and seasonally adjusted monthly or quarterly data in this column. Series maintained by Statistics Canada carry a "D" prefix (e.g. D 1375). The "B" prefix (e.g. B 1437) identifies series in CANSIM which are maintained by the Bank of Canada.

More details on which data is available can be found in the following:

CANSIM Summary Reference Index (Annual with periodic amendments) – Free on request.

This index is a summary of the data in CANSIM. It provides a key to the Series Directory and is the first step in locating and ordering series from the CANSIM Main Base.

CANSIM Main Base Series Directory (Annual with periodic amendments) – $30,00.

This Directory is a detailed guide to the data on the CANSIM Main Base. It gives the title, start date, source of the data, and other descriptive material. The Directory is published in three volumes.

CANSIM Mini Base Series Directory (Annual with periodic amendments) – $10,00.

This Directory is a detailed guide to the data on the CANSIM Mini Base – a standard subset of data originating from the CANSIM Main Base which is available at various Secondary Distributors.

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used in Statistics Canada is the U.S. Bureau of the Census Method II, X-11 variant. Seasonal adjustment removes the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing.

While seasonal adjustment allows a much better look at the underlying trend of a series, the adjusted series will contain irregular fluctuations. Small changes between months in the adjusted series may simply be erratic movements and, to obtain a clearer idea of the underlying trend, users should examine the adjusted series over a number of months. The MCD, or Months for Cyclical Dominance, in a table containing seasonally adjusted series, indicates the smallest span of months for which the average percent change without regard to sign in the trend cycle is greater than that in the irregular factor. For the smoothest series the MCD is 1, for the most erratic series it is 6. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.

Editorial Board

This publication is produced under the guidance of the Canadian Statistical Review Editorial Board, composed of the following Statistics Canada staff members:

G. Leclerc (Chairman) – Assistant Chief Statistician, Economic Accounts and Integration Field
V. Berlinguette – Assistant Chief Statistician, Business Statistics
R.E. Drover – Director, User Advisory Services Division
F. Emmerson – Co-ordinator, Financial Statistics
W. M. Illing – Director, Prices Division
R. Platek – Director, Household Surveys Development Staff
J.R. Podoluk – Director General, Household Statistics Branch
J. Randall – Director, Financial Flows and Multinational Enterprises Division
L.O. Stone – Senior Advisor, Population Studies and Statistics, Census
P.N. Triandafillou – Director, Current Economic Analysis Division
J.S. Wells – Director General, Gross National Product Division
Dr. M. Wisenthal – Director General, Institutions and Public Finance Branch
M. Meguerditchian – Editor, Canadian Statistical Review

Inquiries about the contents of the Canadian Statistical Review should be directed to the editor at : Current Economic Analysis Division, 23rd. Floor, Section M, R.H. Coats Bldg., Tunney's Pasture, Ottawa, Ontario, K1A 0T6.

Subscriptions

The *Canadian Statistical Review* and other catalogued publications of Statistics Canada, including a free annotated catalogue of current publications, may be ordered from Publications Distribution, Statistics Canada, Ottawa, K1A 0T6 and remittances made payable to the Receiver General for Canada.

A weekly supplement containing data published between release dates of this review is distributed free of charge to all subscribers.

Historical data for selected economic indicators, both unadjusted for seasonal variation, are distributed to subscribers in an Annual Supplemment.

Correspondence should be directed to the *Canadian Statistical Review,* Current Economic Analysis Division, Statistics Canada, R.H. Coats Tower, Ottawa, Ontario, K1A 0T6.

Profile of Ph.D.'s in Canada

Max von Zur-Muelhen*

In 1973, Statistics Canada, on behalf of the Ministry of State for Science and Technology, conducted a postcensal survey of university graduates, the Highly Qualified Manpower Survey. It provides a fascinating socio-economic profile of all Canadians who, by the time of the 1971 Census, had achieved formal educational distinction by completing at least one university degree. The Survey has been the basis for this report which will focus on the socio-economic characteristics of the Ph.D. population with permanent residence in Canada[1].

Only a fraction of one percent of the labor force possesses an earned doctorate. Most Ph.D.'s spent 8 to 10 years in university. It has been estimated that in Canada the replacement cost to educate and train each Ph.D. now could be $50,000 to $100,000. Expressing it differently, replacement of the 27,410 Ph.D.'s in Canada would require an investment between $1.4 and $2.7 billion.

Under these circumstances, it is of interest to explore the socio-economic characteristics of this segment of our society. From the unique data of the Highly Qualified Manpower Survey, a number of questions can now be answered about the Ph.D. population. Who and where are they? How many are females? What were their fields of study, their age structure and income? When was the Ph.D. obtained, how many have immigrated, and from where and when? What type of employment and occupations have they selected and what was their salary level?

Number and Labour Force Status of Ph.D.'s

In 1973 there were 27,410 residents of Canada who had obtained an earned doctorate. Generally, these degrees are identified as a Doctor of Philosophy (Ph.D.), but also include such degrees as Doctor of Science, Doctor of Education, Doctor of Business Administration and a variety of doctoral degrees from foreign universities. Excluded are holders of professional doctoral degrees such as Doctor of Medicine, Doctor of Dentistry, and Doctor of Veterinary Medicine.

Of all Ph.D.'s only 9 percent were females. In the Natural Sciences, this proportion was considerably lower while it was higher in some Humanities such as English, Modern Languages and Fine Arts.

The geographic distribution of the Ph.D. population shows the predominance of Ontario where 45.7 percent were located, compared with 35.7 percent of the total Canadian population (Table 1). The Atlantic Provinces and Quebec had proportionally fewer Ph.D.'s than population statistics would have anticipated.

In the fall of 1973, 2.5 percent of the male Ph.D.'s were not working because of unemployment, sickness, further study and voluntary non-labour force participation, compared to 10.2 percent of female Ph.Ds not in the labour force (Table 2). The data do not provide genuine information about the unemployment rate of Ph.D.'s. However, indications are that the percentage is low indeed. This is not suprising if one takes into account that a Ph.D. could substitute for lower level degrees such as bachelors and masters.

Of the 26,485 Ph.D. labour force participants, 4,600 had obtained their degrees in the Humanities (Table 3). There were 150 Ph.D.'s in Classics, 915 in English, and 1,030 in Religion and Theology. The total number of Social Sciences in Ph.D.'s was 6,225 including 1,600 in Education, 1,535 in Psychology, 910 in Economics, and 165 in Anthropology. Agriculture and Biological Sciences had 3,125, Engineering and other Applied Sciences, 2,600, and the Health Professions and Occupations, 2,480. The Physical Sciences were the largest group with 7,425 Ph.D.'s; Chemistry alone had 2,975, and Mathematics, Geology and Physics were represented by well over 1,000 each.

---

*Dr. Max von Zur-Muehlen is Research and Special Projects Coordinator of the Institutional and Public Finance Statistics Branch (Statistics Canada) and has written widely on educational matters.

[1] Preliminary results of this survey have been used to develop the tables on the Ph.D. population in Canada, but without an opportunity to review the statistical reliability of the data. This survey includes not only those who had Ph.D.'s by 1971, but also persons who held a bachelor's or master's degree in 1971 and subsequently obtained their doctorate between the 1971 Census and the 1973 Highly Qualified Manpower Survey. *Excluded* are Ph.D.'s who had immigrated to Canada since 1971, as well as Canadians studying abroad who returned after completing their doctorate after 1971. The stock data for 1973 are under-reported by approximately 2,600 earned doctorates. Consequently, by the fall of 1973, about 30,000 Canadians and landed immigrants held this degree, compared with the 27,410 reported by the Highly Qualified Manpower Survey and discussed in this paper.

As could be expected, for all fields of study, 53.2 percent of Ph.D.'s were teaching in Canadian universities in 1973. This percentage varied according to discipline, from highs of 87.8 percent and 86.3 percent in English and Mathematics, to lows of 33.9 percent in Chemistry, and 32.1 percent in Religion and Theology. In recent years, for the Humanities and Social Sciences, about two out of three Ph.D.'s were employed by universities; by contrast, in the Natural Sciences, about one out of two[2].

Statistics Canada has had a comprehensive data file on university teachers in Canada since 1956-57. The results of the Highly Qualified Manpower Survey 1973, as it applies to university faculty, can be compared with Statistics Canada data for all university teachers with a Ph.D. degree in 1973-74. The Statistics Canada information for 1973-74 should indicate more Ph.D.'s, particularly in the Humanities and Social Sciences, than the Highly Qualified Manpower Survey because the latter does not include immigrant professors and returning Canadians who have come to Canada between 1971 and 1973.

The most striking feature of this comparison is the similarity of results. The Statistics Canada data reported 15,901 university teachers with a Ph.D. for 1973-74 compared with 14,096 for the Highly Qualified Manpower Survey (Table 3). For the Physical and Biological Sciences, the results of the two surveys were almost identical. In the Humanities and Social Sciences, Statistics Canada reported a larger number of university professors with Ph.D. degrees than the Highly Qualified Manpower Survey. Because of these findings, one can place confidence in the ability of the Highly Qualified Manpower Survey to provide an accurate socio-economic description of the Ph.D. population as of the fall of 1973.

Period of Ph.D. Completion and Geographic Origin of Degree

The age structure of the Ph.D. population in Canada shows that only 15.1 percent were above 53 years of age (Table 4). More than 80 percent were between 30 and 53. If one considers that in most disciplines the Ph.D. is received at around 30, Ph.D.'s in Canada are rather young.

In conjunction with the age structure, it is of interest to explore the year of completion of the Ph.D. degree. For example, 55.7 percent received their Ph.D. degrees in the eight-year period from 1965 to 1973, while 9.6 percent had obtained their doctoral degrees before 1950, (Table 5). Frequently, these Ph.D.'s had been awarded by European universities to immigrants who subsequently came to Canada before World War II and during the early post-war years.

These data show that the large majority of Ph.D.'s in Canada were conferred rather recently. In fact, doctoral programs in Canada (except the Natural Sciences, and some Humanities and Social Science programs at McGill and Toronto) were still developing in the sixties and early seventies. Therefore, it is not surprising that only 11,595 or 42.4 percent of the Ph.D. population obtained their degrees at a Canadian university, (Table 6). (Almost half, 45.5 percent, of these Canadian degrees were awarded in Ontario). Another 31.9 percent (8,730) of the Ph.D.'s had been conferred in the United States, and 22.9 percent (6,260) were the products of European institutions. Of the latter, 3,820 were from the United Kingdom; 815 from France and 430 from Italy and the Holy See-mostly Catholic priests. Australia, New Zealand and India provided over 500 Ph.D.'s. These data show Canada's past dependence on the graduate education of other countries. These figures include Canadians who went abroad for their doctoral degrees as well as immigrants who either had acquired their doctoral degrees in their country of origin, or obtained it in a third country.

The Immigration of Ph.D.'s.

Immigration statistics show that 13,915 or 50.8 percent of the Canadian Ph.D. population immigrated to Canada. Of this immigrants, 46.9 percent moved to Ontario, compared with 17.4 percent to Quebec (Table 7). The foreign-born Ph.D.s., by country of birth and period of immigration, show an interesting pattern. Of these immigrants, 25.0 percent came from the United Kingdom and 24.5 percent from the United States (Table 8). India provided 7.5 percent, and almost 24.5 percent misgrated from such European countries as Germany (3.5 percent), France (2.9 percent) and the Netherlands (1.8 percent). The proportion of foreign-born females with doctorates (10.6 percent) was slightly greater than the overall percentage of women in Canada who had Ph.D.'s (9 percent).

By period of immigration, 44.8 percent came to Canada between 1966 and June 1971. In the case of the United States, 3,110 of the 3,415 American immigrants with doctoral degrees came between 1966 and 1971. East bloc countries, such as the

---

[2] This information has been derived from the annual employment survey of the Canadian Association of Graduate Schools.

Soviet Union and Poland, provided a relatively large percentage of immigrants before 1955. Degree-holders from the United Kingdom came throughout the post-war period.

Employment and Occupations of Ph.D.'s

The employment pattern of Ph.D.'s, by sector shows that 62.4 percent (or 17,120) were working in education, (Table 9). The federal government employed 11.3 percent (3,090) compared with 2.7 percent (735) in the provincial governments, and 0.2 percent (50) in municipal governments. Only about 13 percent of the Ph.D. population worked in the industrial sector.

As already discussed, the age structure of the Ph.D. population is rather young. Fewer than one-third of those employed in education are older than 44 years, which means that the replacement rate (on account of retirement, death and disability) under normal conditions would be less than 1.5 percent annually. Ph.D.'s in government are somewhat older: more than 42 percent are older than 44 years and 80 percent of the 620 Ph.D.'s in religious organizations, mostly Catholic priests, are 44 years or older.

The occupations of Ph.D.'s indicate the pre-eminence of university teachers, as already stated. In contrast, fewer than 1,000 were teachers in elementary-secondary education or in post-secondary non-university education, (Table 10). This seems to confirm a widely held belief that Ph.D. employment prospects in teaching other than the university level have not been fully exploited by doctoral graduates.

Ph.D.'s do not always work in the field or area in which they have graduated. This applies particularly to economists and psychologists. Although in 1971, 910 Ph.D.'s in Economics were part of the labour force, only 195 identified themselves as economists. The balance can be asumed to have been employed as university teachers of Economics or Business Administration, as administrators, managers and consultants to government and industry. Similarly, out of the 1,535 Ph.D.'s in Psychology only 365 listed their occupation as psychologist. The same situation applies to a number of other occupations.

Clerical and related occupations were indicated by 110 Ph.D.'s and 165 were employed by the military or as police officers. Another 180 Ph.D.'s were writers, editors, and in related occupations.

In this context, the question arises as to the relationship between field of study and occupation. What is the ideal training for administrators or managers? It appears that many engineers with Ph.D.'s, at least in the industrial sector, perform in this capacity. For clearly defined occupations such as chemist, geologist, pharmacist, or in professions as Theology, Law and Medicine, subject matter expertise is the overriding criterion, but for others, more generalized training in the Social Sciences and Humanities, along with aspirations and motivations, are the critical factors.

Male Ph.D.'s occupy 95 out of 100 positions in most occupations. Psychologists, teachers and pharmacists constitute slightly more females, but even here more than 3 out of 4 incumbents are male. This discrepancy is even more revealing in the next section of this report where salary differentials between the sexes are discussed.

Income and Salary Structure of Ph.D.'s

Salary level is a function of field of study, experience, type of industry, occupations and that of sex. The average (mean) income, for all ages, of male Ph.D.'s in 1973 was $17,900 compared with $10,900 for females, a difference of $7,000[3] (Table 11). For Ph.D.'s born between 1920-1929, the difference was $10,400. The male segment of this age cohort earned $23,600 compared with $13,200 for the female group. It is generally accepted as one of the contributing factors, that female Ph.D.'s have fewer years of work experience due to family formation[4].

The average income pattern of Ph.D.'s since attainment of the degree also varies by sex. The starting salary of Ph.D. holders within two years of graduation was $11,800 for males compared with $9,400 for females. Expressed differently, females earned 79.7 percent of the male income. The more years of experience the more marked becomes the difference in income between the sexes. Females who had held Ph.D'.s for 19 or more years, earned 53.9 percent of their male counterparts' average salary. In dollar terms, a male earned $22,800 whereas the average female's income was $12,300.

Information on median income by employment sector and by type of degrees shows that in education the income of those with a specialized undergraduate degree is $12,100; a masters degree, $15,000; and an earned doctorate, $18,200. In the federal government, bachelor's degree holders have a median income $15,700 compared with $19,800 for those with a Ph.D. In industry, the income differential between a specialized undergraduate degree and the Ph.D. degree was less significant. For example, in

---

[3] The salary data include only those Ph.D. holders who worked 40 weeks or more during the year.

[4] This hypothesis could be tested with more refined tables from the Highly Qualified Manpower Survey, but at present, the discrepancy in salary is only noted. Also, the career profile of such Ph.D. holders could be traced from the Highly Qualified Manpower Survey.

(continue on page 139)

Observations

Provisional National Balance Sheet Accounts

James F. McCollum*

Since the autumn of 1969, Statistics Canada has published a set of detailed financial flow accounts for the Canadian economy on a quarterly basis[1]. While year-end data for financial assets and liabilities for selected sectors and sub-sectors of the financial flows system have been published in the past (typically in the fourth quarter publication of the *Financial Flow Accounts*) no attempt until recently has been made to weave them into a consistent set of accounts.

It has generally been recognized that data on financial transactions or financial flows by themselves are inadequate for a number of purposes and need to be complemented by balance sheet information. The body of economic theory, for example, which is most germane to the interpretation of the financial system is largely couched in terms of stocks or levels rather than flows. Within this body of economic theory, the flows are typically viewed as a consequence of a series of adjustments designed to transform actual balance sheet positions into desired balance sheet positions.

National balance sheet accounts have, for some time, been regarded as an integral part of the overall system of national accounts and appear as a component of the present System of National Accounts (SNA) of the United Nations[2]. Since the stocks of financial instruments are as much a part of the picture as are the transactions in financial instruments, a set of balance sheet accounts can be a useful aid in describing the dimensions of the financial system, in exploring the effects of a variety of influences on the financial system as well as in studying the influences of the financial system on non-financial economic activity. Experience also suggests that in the case of certain instruments, the flows are extremely difficult to interpret even in a loose judgmental way in the absence of information on outstandings.

The present set of accounts is most accurately described as a set of partial balance sheets. The balance sheets are incomplete since they are confined to data on financial assets and liabilities. At a later date, it may be possible to incorporate data on real assets for some of the sectors into the sytem[3]. It appears to be the case, however, that valuation problems as well as other difficulties are sufficiently great that it may be impossible to construct a full system of national balance sheet accounts in the foreseeable future.

Provisional partial balance sheets for the major sectors of the financial flow accounts for the year 1972 accompanies this article. The data are presented in a matrix format similar to the financial flows matrix which appears in the Financial Flow Accounts.

Stocks and Flows

Capital markets have both a flow and a stock (level or outstanding) dimension. The existing set of financial flow accounts attempts to capture the major aspects of the flow dimension of financial activity. The balance sheet accounts are the stock counterpart of the transaction flows in financial instruments. It is important to note that the flows cannot in general be derived by taking the difference between successive stock observations. The change in stocks over a given period of time consists not only of transaction flows but also of valuation adjustments as well as adjustments due to classification changes. An example of the former type of adjustment occurs in the case of foreign currency denominated bank deposits. Stocks of foreign currency denominated bank deposits are converted to Canadian dollars using end of period foreign exchange rates. In order to approximate the transaction flow between the successive end periods, an adjustment has to be made to take account of changes that may have occurred in the exchange rate over the period. An example of the latter type of adjustment occurs when, due to ownership changes, an enterprise shifts from the private to the public sector.

---

*James F. McCollum is chief of the Financial Flows Section of Statistics Canada. A significant role in the development of the present balance sheet estimates was played by Gilles Soucy and Scott Houston who are economists in the Financial Flows Section.

[3] See *Fixed Capital Flows and Stocks: 1971-1975* (Ottawa: Statistics Canada, catalogue 13-211, 1976).

Some Data Weaknesses and Problem Areas

A major problem in attempting to construct a set of national balance sheet accounts is that of valuation. The consensus of current opinion is that financial assets and liabilities should be valued at market prices[4]. Market value data, however, are not available for many of the sub-sectors of the system. Consequently, the present set of accounts reflect a mixture of different valuations. For the most part financial assets and liabilities have been valued at book or carrying value. Research is currently underway to convert certain categories to an uniform market valuation wherever possible.

The use of book values acerbates the problem of obtaining estimates for the personal and unincorporated business sectors (sectors I & II). These estimates are derived residually rather than being based on direct sample observations. In the case of corporate shares, the use of book values on the liability side of the accounts would lead to severe underestimation of the share holdings of the personal and unincorporated business sector at the present time. In order to circumvent this problem, the shares of companies were valued at the net worth of the companies. An independent estimate of the share holdings of the personal and unincorporated business sectors using an average annual dividend yield and the flow of dividends received by the personal and unincorporated business sector was made for comparison purposes. This latter approach yielded estimates below those which appear in these accounts. For example, in 1972 the net worth approach resulted in a residual estimate for the personal and unincorporated business sector of $32 billion while the average rate of return approach yielded an estimate of $22 billion. While it goes without saying that both approaches are subject to considerable error, it should also be noted that this is amongst the most difficult items to estimate in the accounts[5].

In part because the component accounts of the Canadian System of National Accounts were not developed simultaneously as elements of a completely integrated set of accounts and in part because of pragmatic compromises that have been made in the interests of accuracy or economy, a certain number of inconsistencies have arisen in the manner in which the different component accounts of the system treat certain phenomena. These inconsistencies in treatment become most apparent in the financial flow and balance sheet accounts which were developed at later dates than the other components of the system and which draw together data from the other macro-accounting systems.

An example of the type of inconsistency that can arise is the treatment of retained earnings of foreign controlled corporations in Canada in the Canadian System of National Accounts. The *National Income and Expenditure Accounts* (catalogue 13-001), includes retained earnings of foreign controlled corporations in business profits. This is consistent with the treatment in the *Canadian Balance of International Payments* (catalogue 67-001) which excludes retained earnings, of foreign controlled corporations from direct investment in Canada. In the *Financial Flow Accounts* direct investment in Canada is the principal component of category 2512 (Claims on Associated Enterprises – Corporate), in the Rest of the World Account. The treatment of retained earnings of foreign controlled corporations is thus consistent among the three macro-economic flow accounts. In *"Canada's International Investment Position"* accounts (catalogue 67-002) retained earnings are included in the level of direct investment. The balance sheet matrices presented here follow the treatment of the *International Investment Position* accounts rather than the treatment in the flow accounts. A number of practical difficulties including the method used in valuing shares in the balance sheet accounts led to this approach being followed.

In general, the balance sheet accounts are constructed using the same basic sources of information as the financial flow accounts. Over the past several years, descriptions of the data sources and the methods used to obtain financial flows for the various

---

[1] The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. [2] Includes logging, fishing, trapping and hunting. [3] Includes mechanical and construction. [4] Includes a small number in non-specified occupations. [5] Does not include students entering Canada on students' visas. [6] Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force.

[1] Excludes profits (net of losses) of government business enterprises. [2] Includes the withholding tax applicable to this item. [3] Includes profits (net of losses) of government business enterprises and interest and miscellaneous investment income of government. [4] Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. [5] Includes net income of independent professional practitioners. [6] See footnote 4, Table 1.2.

[1] Includes defence expenditures. [2] Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. [3] Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals and business investors. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. [4] The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment, (as shown in Table 1.1). [5] See footnote 4, Table 1.1.

---

[1] The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

---

[1] Includes the taxes on life insurance companies introduced in 1969. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals in so far as their investment activities are concerned. The 1969 taxes are thus included here pending a complete review of the treatment of insurance. [2] Excludes the special refundable tax on corporations introduced in May 1966. Refunding of the tax began in 1968. [3] Withholding taxes. [4] The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four. Since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series.

For source see Table 1.9.

---

[1] These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change.

For source see Table 1.9.

---

[1] The labour force as a percentage of the population 14 years of age and over. The participation rate for a particular group (age, sex etc.) is the labour force in that group expressed as a percentage of the population for that group. Seasonally-adjusted participation rates are obtained by direct adjustment (i.e. by dividing the unadjusted participation rate by the seasonal factor). [2] The unemployed as a percentage of the labour force. The unemployment rate for a particular group (age, sex, etc.) is the unemployed in that group expressed as a percentage of the labour force for that group. Seasonally-adjusted rates are calculated by dividing seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and seasonally-adjusted unemployment (i.e. seasonally-adjusted labour force by summation).

Note: Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. For other explanatory material see notes at the end of Catalogue No. 71-001.

See footnotes, Table 3.

*In addition to the selected Labour Force information published here, there are approximately 2,100 Labour Force series available on CANSIM. The series provide basic labour force characteristics, by geographic area, age, sex and marital status.

Table 4: Selected series by sex and main age group (thousands of persons)

---

[1] Persons who have applied for or are in receipt of unemployment insurance benefit at the end of the month. [2] Annual figures are averages of 12 months. [3] Includes adjustments for cancellation of warrants and collection of overpayments. [4] Trainees under the Adult Occupation Training Act receiving U.I. benefit, prior to July 1975 included with regular benefit.

---

[1] Vacancies for full-time, casual, part-time, seasonal and temporary jobs which were immediately available. [2] Includes Prince Edward Island and the Yukon and Northwest Territories for which separate reliable estimates are not available. [3] Due to postal strike the mail sample was reduced. These estimates should be used with caution due to their reduced reliability.

---

[1] A vacancy rate is obtained by expressing the number of vacancies per thousand existing jobs (sum of vacant and filled jobs) in all industries, except agriculture, fishing and trapping, domestic service and the non-civilian component of public administration and defence. Both full-time and part-time jobs are included. [2] Includes Prince Edward Island and the Yukon and Northwest Territories for which separate reliable estimates are not available. [3] Due to postal strike the mail sample was reduced. These estimates should be used with caution due to their reduced reliability.

[1] In calculating time lost, only the workers directly affected by the strike or lockout are taken into account: time lost by workers indirectly affected, such as those laid off as a result of a work stoppage, is not included. [2] The industry groups prior to January 1973 are based on the 1960 Standard Industrial Classification. From January 1973 forward, the 1970 S.I.C. is used. [3] The number of man-days is calculated by multiplying the number of workers involved in a work-stoppage by the number of normal working days during the stoppage. Adjustments are made for establishments on shift work, etc. [4] The statistics for individual industries exclude strikes and lockouts involving fewer than 100 workers; however, the total includes all work stoppages. The agriculture, finance, insurance and real estate and public administration and defence industries are not shown separately. Should strikes occur in these industries, the time lost also will be shown in the total. In addition, the total is revised quarterly whereas the individual categories are revised annually. [5] Includes miscellaneous manufacturing industries. [6] Includes publishing and allied industries. [7] Includes storage and communication industries.

[1] The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below [2] Excludes agriculture, fishing and trapping, education and related services, health and welfare services, religious organizations, private households, public administration and defence. [3] Includes storage, electric power, gas and water utilities. [4] Excludes domestic service.

[1] The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. The Industrial Composite is the sum of all industries except agriculture, fishing and trapping, education and related services, health and welfare services, religious organizations, private households and public administration and defence.

[1] See footnote 1 and source in Table 10. [2] Employment indexes in total manufacturing and in its total durable and non-durable components are given in Table 9. [3] In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. [4] Except machinery and transportation equipment industries.

---

[1] The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below [2] In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing.

[1] The data for the current year are subject to revision. [2] Includes gold. [3] Consists of general wholesale index less animal products and vegetable products component groups. [4] Consists of iron products and non-ferrous metals products component groups less gold. [5] These two series comprise the general wholesale index. [6] Excludes gold.

---

[1] These rounded weights, provided as a general guide, show the relative importance of the major components of the C.P.I., on average, during the year 1974 [5] Includes shelter and household operation. Until April 1973, the shelter element of regional cities' housing indexes moved on the basis of changes in rents only. However, from May 1973 on home-ownership has been included in the shelter element of regional cities' housing indexes, so that the Canada and regional cities' shelter indexes now contain the same elements.

---

[1] Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been substituted [2] Total new orders received during the period at estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. [3] Total manufacturing inventory owned by manufacturers including warehouse stocks.

---

[1] Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long term contracts result in lai intermittent shipments; for these a monthly estimate of work put in place has been estimated.

[1] Starting with January 1968, production is manufacturers' production; prior to that date production was indicated by the use of excise duty stamps. [2] Intended for cigarettes. [3] Includes pipe, plug, chewing, twist, snuff etc. [4] Includes sales to wholesalers or retailers. [5] Subject to Excise Tax. [6] Includes sales for ships' stores and for export. [7] End of period.

[1] 100 cu. ft. of. solid wood; pulpwood produced for domestic use and excluding exports, but including receipts of purchased roundwood. [2] Total pulp production covers "screenings" which are already included in exports. "Screenings" are excluded throughout from mechanical and chemical pulp. [3] Customs exports. [4] Mill shipments destined for export.

[1] Data compiled according to the Steel Distribution Index revised January, 1964. Figures on net shipments relate to semi finished and rolled steels products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. [2] Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities. [3] Includes appliances and utensils. [4] Excluding shipments for re-processing at maker's own plant.

---

[1] Production plus imports less re-exports, minus exports. [2] Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and distributors) was based on "actual cost to purchaser" rather than the suggested list price as in the past.

Sources: Motor Vehicle Shipments (42-002), New Motor Vehicle Sales (63-007), Trade of Canada, Imports (65-007), Exports (65-004), Statistics Canada.

[1] Gas types are included. [2] Includes producers' shipments for export. [3] In some cases these shipments are not at the factory level, and stocks at beginning of month plus production less shipments do not equal stocks at end of month. [4] End of period. [5] Electric and other. [6] Excludes apartment type machines. [7] Excludes other than electric. **Sources: Domestic Refrigerators and Freezers (43-001), Domestic Washing Machines and Clothes Dryers (43-002), Trade of Canada, Exports (65-004), Imports (65-007), Statistics Canada.**

[1] Includes record players. [2] Includes producers' shipments for export [3] Radio phonograph combinations [4] Includes monaural and stereo with and without amplifiers [5] Excludes producers' shipments for export. [6] Included with "total television receivers". [7] Customs clearance; radio sets include all types, television sets include colour and black and white. **Sources: Radio and Television Receiving Sets (43-004); Trade of Canada, Imports (65-007), Statistics Canada.**

Section 7 · Fuel, Power, Mining

90 1. Electric Power
90 2. Electric Power Available, by Province
91 3. Coal and Coke
91 4. Crude Oil and Natural Gas
92 5. Petroleum Products
93 6. Metals
94 7. Non-metallic Minerals

---

[1] These totals include all generating agencies producing over twenty million kilowatt hours per year. [2] These columns include all generating utilities and generating industries respectively, producing over twenty million kilowatt hours per year. [3] Less imports. [4] Total net generation less net exports.

Note: Components may not add to totals due to rounding. Current figures in this table are preliminary and therefore subject to revision. [1] Supply and disposition for both Crude Oil and Natural Gas will not agree because of losses, inventory changes, pipeline fuel used etc. [2] Includes crude oil, condensate and pentanes plus. [3] Gross new production by field less field flared and waste.

---

[1] Barrels of 35 Canadian gallons. [2] Includes domestic and imported crude oil, condensate and pentanes plus received by Canadian refineries. [3] Refinery production (from crude oil, condensate and pentanes plus, and commingled propane/butane mixes) plus other materials used. [4] Includes deliveries of butane commingled in the crude stream in Saskatchewan and Alberta. [5] Includes inventories at end of period being held at gas plants and in storage caverns. [6] Includes stove oil, kerosene. [7] Includes aviation gasoline and aviation turbo fuel. [8] Due to conceptual changes, the stock and sales series are not available on a comparable basis prior to June 1965 Includes propane and propane mixes and butane and butane mixes. [9] Includes petro-chemical feed stocks, naphtha specialties, coke, lubricating oil and grease, still gas and other products.

---

[1] A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly.

Note: Components may not add to totals due to rounding differences. [1] Data are on a gross basis i.e. they do not take account of cancellations or alterations of loans after initial approval. [2] Agency loans (loans made by other lending institutions on behalf of C.M.H.C.) are included under C.M.H.C. [3] Includes fraternal and mutual benefit societies, Quebec savings banks and, since May 1967, chartered banks. [4] Includes new and existing commercial structures and farm property.

[1] In this context, "softwood" refers to wood from coniferous trees, and hardwood to wood from broadleafed species. [2] Includes export shipments; the softwood lumber column includes domestic shipments are somewhat higher. [4] Production for these items. As reported by principal manufacturers. Total production is somewhat higher. [5] Building contractors, public and utility construction and structural steel fabricators.

[1] Cash receipts from farming operations excluding supplementary payments. Excludes Newfoundland. [2] Represents participation payments made by the Canadian Wheat Board direct to producers on crops delivered in previous years. [3] Includes rye, flaxseed, rapeseed, soybeans and corn. [4] Includes clover and grass seed, hay, clover, greenhouse, mustard seed, sunflower seed, hops, dry beans and dry peas and miscellaneous products. [5] Made under the authority of the Agricultural Stabilization Act.

Note: Components may not add to totals due to rounding. [1]The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when the current annual totals for all firms are known the following year. [2]Excluding trucks. [3]The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers.

[1] Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of output. Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. [2] 1973 and 1974 price indexes are subject to revision. [3] 1974 price indexes are subject to revision. [4] Farm share only of motor vehicles. [5] In addition to the components listed, the major group includes Building Repairs, Fencing Construction and Repairs, Mortgage Credit, and Farm Rent. [6] In addition to components listed, the major group includes Seed, Custom Work, Artificial Insemination, Small Tools and Supplies, and Electricity.

[1] Since January 1975 total milk production has been obtained by adding sales off farms to first receivers (usually marketing boards) and volume used on farms for feeding and farm house consumed. [2] Includes case and bulk. [3] As at end of period. Last month is preliminary. [4] Exclusive of Newfoundland; includes hatching eggs.

---

[1] Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada. Data shown for the last current year are not so adjusted. [2] Production is calculated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. [3] Includes baking and frying oils and fats. [4] Includes stocks held by manufacturers and other warehouses. [5] Includes fresh sausage, frankfurters, weiners and all other sausage. [6] Includes solid, coated, bulk, packages and novelties. [7] The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of 1970, be collected on the basis of factory sales.

---

Note: Components may not add to totals because of rounding.

[1] Credit extended mainly to individuals and chiefly for personal consumption expenditures. Data exclude consumer indebtedness arising from residential mortgages, home-improvement loans and bank loans fully secured against marketable securities. Figures do not include statistics on interpersonal loans, bills owing to doctors, dentists, lawyers, and other personal service credit. [2] Conditional sales agreements held by sales finance companies and by consumer loan companies in connection with the financing of retail purchases of consumers' goods and repaid in instalments. Amounts shown exclude unearned finance charges. [3] Personal cash loans of up to $1,500 made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. [4] Personal cash loans over $1,500, usually repaid in instalments. Amounts shown exclude unearned finance charges. [5] Includes bank-sponsored credit card balances. [6] The data for Quebec savings bank loans are not seasonally adjusted as no seasonality is present: this series is repeated in the unadjusted form. [7] Amount owed by personal (non-commercial) credit card holders to oil companies, airlines, auto-rental firms, and international travel and entertainment credit card issuing companies. [8] Bills due for non-commercial use of telephones, gas and electric power. [9] Personal cash loans only. The data for mortgage and trust companies are not seasonally adjusted because there are not yet enough data to determine a pattern of seasonality: this series is repeated in the unadjusted form.

---

[1] Column numbers refer to tables 3 and 4 section 11. [2] Includes special transaction-trade, not shown separately. [3] The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. [4] Revisions made to ensure consistent coverage. The most important are: Farm machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc.

Source: Trade of Canada, Exports (65-004), Statistics Canada.

Table 4: Merchandise imports, by commodity, based on the standard commodity classification[1] (million dollars)

---

[1] Column numbers refer to tables 3 and 4, section 11. [2] The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. [3] Includes special transaction-trade, not shown separately. [4] Includes scrap. [5] Some series such as General purpose machinery have been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) now include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. **Source: Trade of Canada Imports (65-007), Statistics Canada.**

[1] Beginning with 1970, figures include the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Transair) normally account for approximately 85 per cent of the total revenues and expenses reported by Canadian commercial air carriers. [2] Cargo includes air freight and express but excludes mail and excess baggage.

---

[1] Bank of Canada deposits are averages of the juridical days in the month shown while Bank of Canada notes and Canadian dollar deposit liabilities are averages of the 4 consecutive Wednesdays ending with the second last Wednesday in the previous month. [2] Daily averages for period. [3] Mainly deposits of foreign banks. [4] Capital, rest fund and undivided profits as at the latest fiscal year-end. [5] Including issues payable in foreign currency. [6] Excluding Canadian day-to-day loans. [7] Securities purchased direct from issuer with a term of less than one year at time of issue are classified as loans. [8] Loans to grain dealers and exporters. [9] Loans to finance purchase of Canada Savings Bonds at time of issue. [10] Including loans to instalment finance companies. [11] These series reflect the combination of two CANSIM series.

Note: Components may not add to totals because rounding. [1] This series was designed to cover 50 clearing house centres. With the advent of centralized data processing, bank clearing houses have been eliminated. The current allocation of cheques cashed continues to reflect what had been the previous centres; however, this comparison may not remain valid through time. Discussions are underway in an attempt to establish boundaries which would be more precisely defined. [2] Seasonally adjusted data for Saskatchewan have been deleted because current data could not be satisfactorily adjusted.

---

[1] Excluding revivals, increases, dividend additions, reinsurance acquired, credit insurance and pension bonds without insurance. Value totals are estimates projected from the sales reported by companies operating in Canada representing over 80% of new ordinary and of new group contracts. [2] Total new settled-for ordinary sales in Canada. [3] Total sales figure does not include sales for Northwest Territories. [4] Under new or amended contracts.

---

[1] The number of stocks included has varied over the period, the totals shown in the column headings represent the current coverage. [2] The headings for "base metals" and "industrial mines" are not found in the Standard Industrial Classification. [3] Combines the industrials, utilities and finance common stocks. [4] Stocks included in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. [5] Includes also the machinery industries (except electrical machinery) and the transportation equipment industries. [6] Stocks included in the mining index are for producing mines.

---

[1] This statement includes only receipts relating to budgetary revenue. Excluded are non-budgetary revenues such as Old Age Security Fund taxes, Prairie Farm Assistance Act levies, employer and employee contributions to government-held funds (Unemployment Insurance, Superannuation etc.), interest on government-held funds, and taxes collected on behalf of and transferred to other governments. [2] Beginning in December 1973, this category includes oil export tax. [3] March includes supplementary payments arising from the closing of the accounts. **Sources: The Canada Gazette and Dept. of Finance.**

Figures are rounded and may not add to totals shown.

[1] For comparative purposes figures may differ from those previously reported to reflect changes in accounting during 1973-74 **Source: The Canada Gazette and Dept. of Finance.**

(continued from page 8)

business management, the median income for the first group was $17,700 compared with $18,900 for Ph.D.'s.

It is also interesting to explore the income differential by field of study. With rather few exceptions, the average income for males with a Ph.D. was about $20,000. For some of the Humanities such as Classics and French, the average income was less than $18,000. But in certain professional areas such as Medicine and Surgery, as well as in Economics and Business Administration, average income was substantially higher; in the case of Medicine, $37,600, and $28,800 in Business Administration. Considering that it takes from four to six years to complete a doctorate, the difference in income between a specialized undergraduate degree and a doctorate degree appears small. The average income for males with a specialized undergraduate degree in 1973 was $16,700 compared with $19,600 for earned doctorates. For some fields of study, these differences were less and in others, such as Law and Dentistry, holders of a first professional degree had, on average, higher incomes than those with doctorates.

In summary, the results of the Highly Qualified Manpower Survey as they relate to the Ph.D. population give an excellent overview of the socio-economic characteristics and work activities of the Ph.D.'s in Canada in 1973 (with the exceptions noted in footnote 1). They do not provide behavioural information on motivations or aspirations of Ph.D.'s nor measures of job satisfaction or underutilization. Nevertheless, the quantitative data highlight important dimensions of issues which require further study.

Table 1. Ph.D.'s by Province of Residence and Sex

	Male	Female	Total	Percent	Population 1971
Newfoundland	265	30	295	1.1	2.4
Prince Edward Island	65	5	70	0.3	0.5

(continued from page 10)

sectors have appeared in the Financial Flow Accounts (catalogue 13-002) on a regular basis. However, due to the changing structure of the Canadian financial system as well as changes in the form and sources of data, some of these descriptions are now obsolete. A revised documentation of the flow accounts and the balance sheet accounts is in preparation and will appear at a later date.

Further Work

At the present time, work on the balance sheet accounts is proceeding on two fronts. Annual time series for the sectors and sub-sectors as well as annual matrices are being developed. Concurrently, efforts are being made to rectify a number of data deficiencies which have become apparent in the construction of these preliminary accounts.

Canadian Statistical Review

Data in this publication were retrieved from CANSIM(R) (Registered Trade Mark of Statistics Canada for its Canadian Socio-Economic Information Management System), and processed to create a photo-ready copy from which this publication was produced. CANSIM is the Statistics Canada computerized data bank; series published in this Review (as well as other data) are available on computer printouts, cards, tape or directly via terminal.

The identification numbers at the top of each column of data refer to the unadjusted and seasonally adjusted monthly or quarterly data in this column. Series maintained by Statistics Canada carry a "D" prefix (e.g. D 1375). The "B" prefix (e.g. B 1437) identifies series in CANSIM which are maintained by the Bank of Canada.

More details on which data is available can be found in the following:

CANSIM Summary Reference Index (Annual with periodic amendments) – Free on request.

This index is a summary of the data in CANSIM. It provides a key to the Series Directory and is the first step in locating and ordering series from the CANSIM Main Base.

CANSIM Main Base Series Directory (Annual with periodic amendments) – $30.

This Directory is a detailed guide to the data on the CANSIM Main Base. It gives the title, start date, source of the data, and other descriptive material. The Directory is published in three volumes.

CANSIM Mini Base Series Directory (Annual with periodic amendments) – $10.

This Directory is a detailed guide to the data on the CANSIM Mini Base – a standard subset of data originating from the CANSIM Main Base which is available at various Secondary Distributors.

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used in Statistics Canada is the U.S. Bureau of the Census Method II, X-11 variant. Seasonal adjustment removes the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing.

While seasonal adjustment allows a much better look at the underlying trend of a series, the adjusted series will contain irregular fluctuations. Small changes between months in the adjusted series may simply be erratic movements and, to obtain a clearer idea of the underlying trend, users should examine the adjusted series over a number of months. The MCD, or Months for Cyclical Dominance, in a table containing seasonally adjusted series, indicates the smallest span of months for which the average percent change without regard to sign in the trend cycle is greater than that in the irregular factor. For the smoothest series in MCD is 1, for the most erratic series it is 6. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.

Editorial Board

This publication is produced under the guidance of the Canadian Statistical Review Editorial Board, composed of the following Statistics Canada staff members:

G. Leclerc (Chairman) – Assistant Chief Statistician, Economic Accounts and Integration Field
V. Berlinguette – Assistant Chief Statistician, Business Statistics
R.E. Drover – Director, User Advisory Services Division
F. Emmerson – Co-ordinator, Financial Statistics
R. Platek – Director, Household Surveys Development Staff
J.R. Podoluk – Director General, Household Statistics Branch
J. Randall – Director, Financial Flows and Multinational Enterprises Division
L.O. Stone – Senior Advisor, Population Studies and Statistics, Census
P.N. Triandafillou – Director, Current Economic Analysis Division
J.S. Wells – Director General, Gross National Product Division
Dr. M. Wisenthal – Director General, Institutions and Public Finance Branch
G. Bériault-Prud'homme – Editor, Canadian Statistical Review

Inquiries about the contents of the Canadian Statistical Review should be directed to the editor at : Current Economic Analysis Division, 23rd. Floor, Section M, R.H. Coats Bldg., Tunney's Pasture, Ottawa, Ontario, K1A 0T6.

Subscriptions

The *Canadian Statistical Review* and other catalogued publications of Statistics Canada, including a free annotated catalogue of current publications, may be ordered from Publications Distribution, Statistics Canada, Ottawa, K1A 0T6 and remittances made payable to the Receiver General for Canada.

A weekly supplement containing data published between release dates of this review is distributed free of charge to all subscribers.

Historical data for selected economic indicators, both adjusted and unadjusted for seasonal variation, are distributed to subscribers in an Annual Supplemment.

Correspondence should be directed to the *Canadian Statistical Review,* Current Economic Analysis Division, Statistics Canada, R.H. Coats Tower, Ottawa, Ontario, K1A 0T6.

Note to Users

This section is used to announce changes in tables of the *Canadian Statistical Review* and in related CANSIM series.

Section 4, Table 3 to Table 5 – Labour Force

With this issue a selection of series from the revised Labour Force Survey has been introduced. Annual figures for these series are not yet available but will be included in a future issue. For further information see Observations, *Canadian Statistical Review*, March 1976.

Earnings and Unemployment Experience of Canadians, 1971-1973

R.K. Chawla*

The high rate of unemployment among Canadians recently has generated concern about the nature and sources of income for the unemployed. To provide some insights into this issue, it is useful to examine the work and unemployment experience of individuals in conjunction with their incomes and family situations. What relative roles have earnings and transfer payments played in the incomes of the unemployed? How do these roles vary over different members of the household, over different income groups, or over different regions of Canada? This paper provides some answers to these questions, based on survey data for 1971 and 1973.

The analysis is based on data for individuals, collected in the Surveys of Consumer Finances (SCF) – taken in conjunction with the Labour Force Surveys (LFS) – in April 1972 and 1974.[1] Using the full LFS sample of approximately 35,000 households from across the country, the SCF sought information on incomes during the reference year. Information on the respondent's work experience during the reference year, and his or her labour force activity at the time of the survey, was also collected.

Individuals who had no work and looked for work for one or more weeks during the reference year are considered to have experienced some unemployment. However the present analysis excludes persons who were in the labour force only due to their job search activities, and who had no cash income to report for the reference year. Their numbers were small (149,000 or 8.9 percent of the unemployed in 1971, and 83,000 or 5.6 percent in 1973), and most of them were "new seekers" who had entered the labour force for the first time. Also, it should be noted that an individual who was unemployed at any time during the reference year (at least for one week) did not necessarily have to work during the remainder of the reference year; he or she may have been outside the labour force during this period.

With these data it is possible to examine the incidence of unemployment, by member of the household, by income group, and by region.[2] The paper gives information on the change in the incidence of unemployment among heads of families, wives, children and unattached individuals, as well as the change in their respective earnings and other income between 1971 and 1973.[3]

As the data originate from surveys for two different years, it is possible to examine changes in the incidence of unemployment over time.

According to the SCF data, the estimated number of labour force participants who had reported some cash income during the reference year rose from 8,957 thousand in 1971 to 10,094 thousand in 1973, an increase of 12.7 percent. The number of persons who experienced one or more weeks of unemployment during the reference year fell from 1,521 thousand in 1971 to 1,400 thousand in 1973, a drop of 8.0 percent. Thus, the overall incidence of unemployment fell from 17.0 percent in 1971 to 13.9 percent in 1973.[4] With the two survey years showing somewhat different labour market conditions, it is useful to compare the patterns of unemployment incidence in these two different periods.

---

*Mr. Chawla is an economist on the staff of the Consumer Income and Expenditure Division.

[1] For a full description of the two surveys, see "Income Distributions by Size in Canada," Catalogue 13-207 (annual) for the years 1971 and 1973.

[2] The "incidence of unemployment" and other concepts used here are defined in the Appendix.

[3] The data presented here update some of the previously published data on the 1971 incomes of unemployed individuals and their families, as well as on the 1971 earnings and work experience of the Canadian labour force. See Statistics Canada Cat. 13-552, "Incomes of Unemployed Individuals and Their Families, 1971," and Cat. 13-554, "Earnings and Work Experience of the 1971 Labour Force." Some additional tables updating the data published in these two reports are now available for the year 1973. For further information, contact Mrs. A. Paoliello (613-992-4742), Consumer Income and Expenditure Division.

[4] The average annual unemployment rates estimated from the monthly LFS were 6.4 percent and 5.6 percent in 1971 and 1973 respectively. See "The Labour Force," Cat. 71-001, May 1974, Table 32, p. 59.

Earnings and Unemployment Experience of Individuals

Table 1 shows that in both 1971 and 1973, a male earner with no unemployment experience earned on average 89 percent more than one who did experience some unemployment. Put another way, persons experiencing some unemployment were largely concentrated in the lower earnings groups, with over 60 percent of the male and over 90 percent of the female earners experiencing unemployment, in both reference years, earning less than $5,000.

Whether or not a person experienced unemployment, his or her earnings constituted the major share of total income, as is evident in Table A. However the earnings to income ratio was larger for those who experienced no unemployment. The ratio does not show any substantial change between the two years, except in the case of females experiencing some unemployment. In 1973 these females had on average 21.4 cents of every income dollar in the form of non-earned income (that is, income from transfer payments, investment, and other miscellaneous sources), compared to their counterparts in 1971 who had only 11.6 cents of such income per dollar of total income. Thus, between 1971 and 1973 non-earned income became relatively more important for female earners experiencing some unemployment, but changed relatively little for the male earners.

Earnings and Unemployment Experience of Individuals by Their Relationship to the Family Head

Table 2 shows that of all individuals experiencing unemployment in 1971, 41 percent were heads of families, and 46 percent were wives and children.[5] In 1973 these proportions had changed to 36 percent and 50 percent respectively. Table B shows that the relatively higher proportion for wives and children in 1973 is a consequence of their increased participation in the labour force. Unpublished data further confirm this, by indicating that 61.2 percent of the increase in the labour force over the two years is accounted for by wives and children.

Table 2 also indicates that the decline in the incidence of unemployment over the 1971-1973 period was distributed among all classes of individuals – heads of families, wives, children, and unattached individuals. For both years, the incidence was lowest for family heads, who are usually the main breadwinners. Their earnings alone constituted 62.4 percent of total family income in 1971, but this proportion declined to 57.0 percent in 1973, largely because of the increased labour force participation of wives and children.

Table 3 provides some interesting insights into the overall economic situation of families of unemployed individuals. It shows that the incidence of unemployment among wives and children was consistently highest for those families in the $4,000 – $6,999 income group. Also, unemployment among children was relatively higher than among wives, in both years and in all family income groups.

An individual with some unemployment experience in 1973 was typically in the labour force for a comparatively shorter period than was his or her 1971 counterpart. Table 2 shows that such a person looked for a job or was without work for an average of 17.5 weeks in 1973, compared with 19.7 weeks in 1971, while his or her average weeks worked remained almost the same for both of the reference years.

Average transfer payments received by individuals experiencing some unemployment were $746 in 1973, an increase of 102.7 percent over the figure of $368 in 1971. The largest average transfer payment went to family heads, $638 in 1971 and $1,152 in 1973. Table 3 further shows that the share of total family income attributed to transfer payments received by family heads increased from 8.4 percent

---

[5] The classification of "children" is based on a person's relationship to the family head, not on his or her age. It includes all persons aged 14 years and over, who are related to the family head as sons/sons-in-law or daughters/daughters-in-law.

TABLE A: Earnings to Income Ratio[1] by Unemployment Experience and by Sex, 1971 and 1973

Sex of Earner	Experienced No Unemployment		Experienced Some Unemployment	
	1971	1973	1971	1973
	Percent			
Male	93.3	93.7	88.1	83.1
Female	92.9	92.9	88.4	78.6

[1] Calculated by dividing average earnings by average income.

TABLE B: Incidence of Unemployment and the Participation Rate for Individuals by Their Relationship to the Family Head, 1971 and 1973[1]

Relationship to Head	Incidence of Unemployment		Participation Rate	
	1971	1973	1971	1973
	Percent			
Head	13.4	10.3	86.3	86.3
Wife	15.5	13.5	69.6	73.0
Children	26.8	20.8	84.8	91.3
Unattached Individual	19.7	16.6	61.6	65.0
All Individuals[2]	17.0	13.9	78.0	80.4

[1] This Table is based on information from a sample, the universe of which consisted of all individuals aged 14 years and over who reported some cash income for the reference year. The incidence of unemployment and the participation rate are defined in the Appendix.

[2] Includes all other family members not separately shown (whose numbers are quite small). See Table 2, footnote (3).

Source: Table 2 and unpublished data from the 1971 and 1973 SCF.

to 11.9 percent, over the two year period. For unattached individuals, the increase was from 7.9 percent to 13.0 percent. Increased transfer payments have therefore improved the incomes of primary labour force participants over this period.

Not surprisingly, the ratio of transfer payment income to total income is consistently highest for low income families and lowest for high income families. Heads of families with incomes less than $4,000 have benefited most from transfer payments – which constituted 37.5 percent of their total family income in 1973 compared with 28.5 percent in 1971. A similar increase occurred in the case of unattached individuals with incomes under $4,000.

The increase in average transfer payments received by unemployed individuals is due partially to higher average receipts of unemployment insurance benefits. Weekly benefit rates were increased between 1971 and 1973; and beneficiaries on average collected benefits for a longer period in 1973. Furthermore, it is likely that transfer payments other than unemployment insurance also increased.[6]

Family Income and Unemployment Experience of Family Members

The unemployment experience of family members is shown by region in Table 4. In this Table, the universe of all families is broken down into three groups – those families in which no family member experienced any unemployment, those in which the family head experienced some unemployment, and those in which some family member other than the family head experienced some unemployment. Note however that families whose members experienced no unemployment were not necessarily families experiencing employment; this group includes some families in which no member was in the labour force.

Between 1971 and 1973, the proportion of families with members experiencing no unemployment increased in all of the five regions, the highest increase of 4.4 percentage points occurring in the Prairie provinces. In all regions except the Atlantic provinces, there was a relative decline in the number of families with heads unemployed. With the exception of British Columbia, there was also a relative fall in the number of families with members other than the head unemployed. Evidently the decline in the incidence of unemployment between 1971 and 1973 was felt in all regions of Canada.

Unpublished data reveal an average duration of unemployment for family heads of 15.7 weeks in 1971 and 15.5 weeks in 1973. More significantly, in those families whose heads did experience some unemployment, the proportion who were unemployed for 27 weeks or more declined from 24 percent to 21 percent. These families were largely concentrated in the group with incomes under $5,000.

Average family income rose from $10,368 in 1971 to $12,716 in 1973, an increase of 22.6 percent. Table 4 shows that for Canada as a whole, and for Quebec, British Columbia, and the Prairie provinces in particular, average income for families with members other than the head unemployed grew more, both in dollars and in percentage terms, than that for

---

[6] Total transfer payments from governments to persons rose from $8.3 billion in 1971 to $11.2 billion in 1973, an increase of 34.3 percent. Total unemployment insurance benefits paid to persons increased by 124.9 percent, from $891 million to $2,004 million; and average weekly benefits per recipient rose from $39.35 in 1971 to $68.51 in 1973. See the *Canadian Statistical Review*, Sections 3 and 4, November issues of 1972 and 1974.

Observations

Fixed Capital Flows and Stocks, 1972 to 1976—CANSIM Data

A new set of annual estimates of stocks and flows and related estimates of fixed non-residential capital in Canada, based on the 1960 and the 1970 revision of the Standard Industrial Classification by major industries and detailed types of assets, is now available for the period 1972 to 1976, in both current and constant 1961 and 1971 dollars. These data are available in computer printout form and on magnetic tape.

For further information, contact Mr. S. Bernard (613-994-5601), Construction Division, Statistics Canada, Ottawa, Ontario, K1A 0T6. To order any data from CANSIM on magnetic tape or computer printouts, contact Gina Pilozzi (613-995-7406), CANSIM Staff, Statistics Canada, Ottawa, Ontario, K1A 0Z8.

Report on Aggregate Productivity Measures, 1946-1974

In May 1976, the Input-Output Division released a sequel to the 1946-72 issue of the report titled *Aggregate Productivity Measures*. The new edition presents data for 1973 and 1974 and revisions to the immediately preceeding years.

Aggregate Productivity Measures, 1946-1974 (Catalogue 14-201) is available for $1.05 from Publications Distribution, Statistics Canada, Ottawa, Ontario, K1A 0T6.

Inquiries about the contents of this report may be directed to Mr. A.B. McCormick, Input-Output Division, Statistics Canada, Ottawa, K1A 0T6 (613-995-8261).

Water Transportation

In 1975, the Transportation and Communications Division conducted a special industry profiling survey of Canadian domiciled water carriers based on 1974 activities. Preliminary results of this survey were released in June 1976 and are presented in a statistical report titled *The Water Transportation Data Sheet 1974*.

The objectives of the survey were to provide a rigorous foundation for the definitions and concepts used by the water transport industry; to facilitate improvement in future questionnaire design; to measure and analyse the economic variables of the industry; and to improve the coverage of the water transport industry.

Inquiries about the contents of this publication may be directed to Mr. Denis Chartrand, Chief, Water Transport Section (613-996-9274), Transportation and Communication Division, Statistics Canada, Ottawa, K1A 0T6.

Goal for Women

Opportunity for Choice: A Goal for Women in Canada, a book produced jointly by Statistics Canada and the C.D. Howe Research Institute, was prepared following International Women's Year as a continuing contribution to the role of women in Canadian Society. It is designed to broaden understanding of the role of women, both for the general reader concerned with the place of women in society and for professionals in the disciplines of demography, economics, law, sociology and statistics.

The publication contains a presentation of Statistics Canada data on women's participation in the family, educational institutions and the labour force and a comprehensive analysis and evaluation of the evidence. It presents an examination of the effectiveness of existing policies and proposes new ones relevant to the role of women. As the title indicates, a theme of the books is the extent to which women, and men, have opportunities to make choices concerning their roles.

This publication (Catalogue 1C 2315/1976) is available at a cost of $3.75 from Printing and Publishing, Supply and Services, Canada, Ottawa, K1A 0S9.

Please enclose a money order or cheque made payable to the order of: Receiver-General for Canada.

Canada 1976

This year's edition of Statistics Canada's Handbook *Canada* has just been published. It presents a view of life in this country and a summary of recent social, cultural and economic developments. Textual and statistical material has been provided by various divisions of Statistics Canada, by other government departments and by special contributors. Articles on Canada's geography, history, arts and culture, religion, scientific activities, and recreation and tourism are features of this edition.

Superbly illustrated, *Canada 1976* contains some 300 photographs – 250 in full colour; these illustrations have been selected from a wide range of governmental, commercial, press and private sources.

This publication (catalogue 11-203E) is available from Publication Distribution, Room 1200, Main Bldg., Statistics Canada, Ottawa, K1A 0T6. Please enclose a money order or a cheque made payable to the order of the Receiver-General for Canada. Price: Canada – $2.75; other countries – $3.30.

---

[1] The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. [2] Includes logging, fishing, trapping and hunting. [3] Includes mechanical and construction. [4] Includes a small number in non-specified occupations. [5] Does not include students entering Canada on students' visas. [6] Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force.

Section 3 · System of National Accounts

1. Income and Expenditure Accounts

28 1.1 National Income and Gross National Product
28 1.2 Gross National Expenditure, Current Dollars
29 1.3 Gross National Expenditure, Constant Dollars
29 1.4 Sources of Personal Income
30 1.5 Disposition of Personal Income
30 1.6 Sources and Disposition of Gross Savings
31 1.7 Government Revenue, Expenditure, and Surplus of Deficit, by Level of Government
35 1.8 Implicit Price Indexes
35 1.9 Relation between Gross National Product at Market Prices and Gross Domestic Product at Factor Cost

2. Domestic Product by Industry

36 2.1 Real Domestic Product by Industry of Origin, Quarterly
37 2.2 Real Domestic Product by Industry of Origin, Monthly

3. Balance of International Payments

42 3.1 Canadian Balance of International Payments, Current Account, All Countries
42 3.2 Canadian Balance of International Payments, Current Account, Country Distribution
43 3.3 Canadian Balance of International Payments, Capital Account, All Countries

1—Income and expenditure accounts

Table 1.1: National income and gross national product (millions of dollars)

Year and quarter	Wages, salaries, and supplementary labour income	Military pay and allowances	Corporation profits before taxes[1]	Deduct. dividends paid to non-residents[2]	Interest & misc. investment income[3]	Accr'd net income of farm operators from farm prod.[4]	Net income of non-farm un-incorp. business incl. rent[5]	Inventory valuation adjust.[6]	Net national income at factor cost	Indirect taxes less subsidies	Capital consump. allowances & misc. val. adj.	Residual error of estimate	GNP at market prices	GNP at market prices excl. accrued net income of farm operators

[1] Excludes profits (net of losses) of government business enterprises [2] Includes the withholding tax applicable to this item. [3] Includes profits (net of losses) of government business enterprises and interest and miscellaneous investment income of government [4] Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. [5] Includes net income of independent professional practitioners [6] See footnote 4, Table 1 2

[1] Includes defence expenditures [2] Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure [3] Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals and business investors. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. [4] The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change The difference between the value of physical change and the change in book value is called the inventory valuation adjustment, (as shown in Table 1 1). [5] See footnote 4, Table 1 1

[1] The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

[1] Includes the taxes on life insurance companies introduced in 1969. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals in so far as their investment activities are concerned. The 1969 taxes are thus included here pending a complete review of the treatment of insurance. [2] Excludes the special refundable tax on corporations introduced in May 1966. Refunding of the tax began in 1968. [3] Withholding taxes. [4] The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four. Since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series.

For source see Table 1.9.

---

[1] These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change.

For source see Table 1.9.

Table 1.9: Relation between gross national product at market prices and gross domestic product at factor cost (millions of dollars)

Year and quarter	Gross national product at market prices	Deduct			Add	Gross domestic product at factor cost	Gross national product at market prices	Deduct			Add	Gross domestic product at factor cost
		Residual error of estimate	Indirect taxes less subsidies	Investment income received from non-residents	Investment income paid to non-residents			Residual error of estimate	Indirect taxes less subsidies	Investment income received from non-residents	Investment income paid to non-residents

---

[1] The labour force as a percentage of the population 15 years of age and over. The participation rate for a particular group (age, sex etc.) is the labour force in that group expressed as a percentage of the population for that group.

[2] The unemployed as a percentage of the labour force. The unemployment rate for a particular group (age, sex etc.) is the unemployed in that group expressed as a percentage of the labour force for that group. Seasonally-adjusted rates are calculated by dividing seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and seasonally-adjusted unemployment (i.e. seasonally-adjusted labour force by summation)

Note: Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. For other explanatory material see notes at the end of Catalogue No. 71-001

Source: The Labour Force (71-001 Monthly) and Seasonally adjusted labour force statistics – January 1970 – December 1975, Statistics Canada.

---

[1] A vacancy rate is obtained by expressing the number of vacancies per thousand existing jobs (sum of vacant and filled jobs) in all industries, except agriculture, fishing and trapping, domestic service and the non-civilian component of public administration and defence. Both full-time and part-time jobs are included. [2] Includes Prince Edward Island and the Yukon and Northwest Territories for which separate reliable estimates are not available. [3] Due to postal strike the mail sample was reduced. These estimates should be used with caution due to their reduced reliability.

[1] In calculating time lost, only the workers directly affected by the strike or lockout are taken into account: time lost by workers indirectly affected, such as those laid off as a result of a work stoppage, is not included. [2] The industry groups prior to January 1973 are based on the 1960 Standard Industrial Classification. From January 1973 forward, the 1970 S.I.C. is used. [3] The number of man-days is calculated by multiplying the number of workers involved in a work-stoppage by the number of normal working days during the stoppage. Adjustments are made for establishments on shift work, etc. [4] The statistics for individual industries exclude strikes and lockouts involving fewer than 100 workers; however, the total includes all work stoppages. The agriculture, finance, insurance and real estate and public administration and defence industries are not shown separately. Should strikes occur in these industries, the time lost also will be shown in the total. In addition, the total is revised quarterly whereas the individual categories are revised annually [5] Includes miscellaneous manufacturing industries. [6] Includes publishing and allied industries. [7] Includes storage and communication industries.

[1] The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below The Industrial Composite is the sum of all industries except agriculture, fishing and trapping, education and related services, health and welfare services, religious organizations, private households and public administration and defence.

[1] See footnote 1 and source in Table 10. [2] Employment indexes in total manufacturing and in its total durable and non-durable components are given in Table 9. [3] In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing [4] Except machinery and transportation equipment industries.

Table 12: Average weekly wages and salaries,[1] by industrial division, based on the 1960 standard industrial classification (dollars)

[1] The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. [2] In addition to those listed, tobacco products; knitting mills; printing, publishing and allied, and miscellaneous manufacturing industries are included in non-durable manufacturing.

---

[1] These rounded weights, provided as a general guide, show the relative importance of the major components of the C.P.I., on average, during the year 1974 [5] Includes shelter and household operation. Until April 1973, the shelter element of regional cities' housing indexes moved on the basis of changes in rents only. However, from May 1973 on home-ownership has been included in the shelter element of regional cities' housing indexes, so that the Canada and regional cities' shelter indexes now contain the same elements.

---

[1] Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been substituted [2] Total new orders received during the period at estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month [3] Total manufacturing inventory owned by manufacturers including warehouse stocks.

Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.

---

[1] Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been estimated

[1] 100 cu. ft. of solid wood; pulpwood produced for domestic use and excluding exports, but including receipts of purchased roundwood. [2] Total pulp production covers "screenings" which are already included in exports. "Screenings" are excluded throughout from mechanical and chemical pulp. [3] Customs exports. [4] Mill shipments destined for export.

[1] Data compiled according to the Steel Distribution Index revised January, 1964. Figures on net shipments relate to semi finished and rolled steels products only. Shipments to consuming industries of castings, forgings and steel pipe are not included [2] Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities. [3] Includes appliances and utensils. [4] Excluding shipments for re-processing at maker's own plant.

---

[1] Production plus imports less re-exports, minus exports. [2] Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and distributors) was based on "actual cost to purchaser" rather than the suggested list price as in the past.

Sources: Motor Vehicle Shipments (42-002), New Motor Vehicle Sales (63-007), Trade of Canada, Imports (65-007), Exports (65-004), Statistics Canada.

Note: Components may not add to totals due to rounding. Current figures in this table are preliminary and therefore subject to revision. [1] Supply and disposition for both Crude Oil and Natural Gas will not agree because of losses, inventory changes, pipeline fuel used etc. [2] Includes crude oil, condensate and pentanes plus. [3] Gross new production by field less field flared and waste.

---

[1] Barrels of 35 Canadian gallons [2] Includes domestic and imported crude oil, condensate and pentanes plus received by Canadian refineries. [3] Refinery production (from crude oil, condensate and pentanes plus, and commingled propane/butane mixes) plus other materials used. [4] Includes deliveries of butane commingled in the crude stream in Saskatchewan and Alberta [5] Includes inventories at end of period being held at gas plants and in storage caverns. [6] Includes stove oil, kerosene. [7] Includes aviation gasoline and aviation turbo fuel. [8] Due to conceptual changes, the stock and sales series are not available on a comparable basis prior to June 1965. Includes propane and propane mixes and butane and butane mixes. [9] Includes petro-chemical feed stocks, naphtha specialties, coke, lubricating oil and grease, still gas and other products.

---

[1] A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly.

Note: Components may not add to totals due to rounding differences. [1]Data are on a gross basis i.e. they do not take account of cancellations or alterations of loans after initial approval. [2]Agency loans (loans made by other lending institutions on behalf of C.M.H.C.) are included under C.M.H.C. [3]Includes fraternal and mutual benefit societies, Quebec savings banks and, since May 1967, chartered banks. [4]Includes new and existing commercial structures and farm property.

[1] In this context, "softwood" refers to wood from coniferous trees, and hardwood to wood from broadleafed species. [2] Includes export shipments; the softwood lumber column includes domestic shipments are somewhat higher. [4] Production for these items. As reported by principal manufacturers. Total production is somewhat higher. [5] Building contractors, public and utility construction and structural steel fabricators.

Note: Components may not add to totals due to rounding. [1] The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when the current annual totals for all firms are known the following year. [2] Excluding trucks. [3] The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers.

---

[1] Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of output. Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. [2] 1973 and 1974 price indexes are subject to revision. [3] 1974 price indexes are subject to revision. [4] Farm share only of motor vehicles. [5] In addition to the components listed, the major group includes Building Repairs, Fencing Construction and Repairs, Mortgage Credit, and Farm Rent. [6] In addition to components listed, the major group includes Seed, Custom Work, Artificial Insemination, Small Tools and Supplies, and Electricity.

[1] Since January 1975 total milk production has been obtained by adding sales off farms to first receivers (usually marketing boards) and volume used on farms for feeding and farm house consumed. [2] Includes case and bulk. [3] As at end of period. Last month is preliminary. [4] Exclusive of Newfoundland; includes hatching eggs.

---

[1] Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada. Data shown for the last current year are not so adjusted. [2] Production is calculated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. [3] Includes baking and frying oils and fats. [4] Includes stocks held by manufacturers and other warehouses. [5] Includes fresh sausage, frankfurters, weiners and all other sausage. [6] Includes solid, coated, bulk, packages and novelties. [7] The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of 1970, be collected on the basis of factory sales.

Note: Components may not add to totals due to rounding and partial revisions. [1]Fully secured by marketable bonds and stocks. Excludes loans to finance the purchase of Canada Savings Bonds. [2]Includes loans on the security of household property. [3]Not available on a monthly basis. [4]Includes loans to finance companies which are affiliates of retail merchandisers. [5]Religious, educational, health and welfare institutions. [6]Differs from general loans in Section 13, Table 2 by the exclusion of loans to instalment finance companies.

---

Note: Components may not add to totals because of rounding.

[1] Credit extended mainly to individuals and chiefly for personal consumption expenditures. Data exclude consumer indebtedness arising from residential mortgages, home-improvement loans and bank loans fully secured against marketable securities. Figures do not include statistics on interpersonal loans, bills owing to doctors, dentists, lawyers, and other personal service credit. [2] Conditional sales agreements held by sales finance companies and by consumer loan companies in connection with the financing of retail purchases of consumers' goods and repaid in instalments. Amounts shown exclude unearned finance charges. [3] Personal cash loans of up to $1,500 made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. [4] Personal cash loans over $1,500, usually repaid in instalments. Amounts shown exclude unearned finance charges. [5] Includes bank-sponsored credit card balances. [6] The data for Quebec savings bank loans are not seasonally adjusted as no seasonality is present: this series is repeated in the unadjusted form. [7] Amount owed by personal (non-commercial) credit card holders to oil companies, airlines, auto-rental firms, and international travel and entertainment credit card issuing companies. [8] Bills due for non-commercial use of telephones, gas and electric power. [9] Personal cash loans only. The data for mortgage and trust companies are not seasonally adjusted because there are not yet enough data to determine a pattern of seasonality: this series is repeated in the unadjusted form.

---

[1] Column numbers refer to tables 3 and 4 section 11. [2] Includes special transaction-trade, not shown separately. [3] The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. [4] Revisions made to ensure consistent coverage. The most important are: Farm machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc.

Source: Trade of Canada, Exports (65-004), Statistics Canada.

Table 4: Merchandise imports, by commodity, based on the standard commodity classification[1] (million dollars)

---

[1] Column numbers refer to tables 3 and 4, section 11. [2] The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. [3] Includes special transaction-trade, not shown separately. [4] Includes scrap. [5] Some series such as General purpose machinery have been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) now include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. **Source: Trade of Canada Imports (65-007), Statistics Canada.**

[1] Beginning with 1970, figures include the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Transair) normally account for approximately 85 per cent of the total revenues and expenses reported by Canadian commercial air carriers. [2] Cargo includes air freight and express but excludes mail and excess baggage.

---

[1] Bank of Canada deposits are averages of the juridical days in the month shown while Bank of Canada notes and Canadian dollar deposit liabilities are averages of the 4 consecutive Wednesdays ending with the second last Wednesday in the previous month [2] Daily averages for period [3] Mainly deposits of foreign banks. [4] Capital, rest fund and undivided profits as at the latest fiscal year-end [5] Including issues payable in foreign currency [6] Excluding Canadian day-to-day loans. [7] Securities purchased direct from issuer with a term of less than one year at time of issue are classified as loans [8] Loans to grain dealers and exporters [9] Loans to finance purchase of Canada Savings Bonds at time of issue [10] Including loans to instalment finance companies [11] These series reflect the combination of two CANSIM series.

Note: Components may not add to totals because rounding. [1]This series was designed to cover 50 clearing house centres. With the advent of centralized data processing, bank clearing houses have been eliminated. The current allocation of cheques cashed continues to reflect what had been the previous centres; however, this comparison may not remain valid through time. Discussions are underway in an attempt to establish boundaries which would be more precisely defined. [2]Seasonally adjusted data for Saskatchewan have been deleted because current data could not be satisfactorily adjusted.

---

[1] Excluding revivals, increases, dividend additions, reinsurance acquired, credit insurance and pension bonds without insurance. Value totals are estimates projected from the sales reported by companies operating in Canada representing over 80% of new ordinary and of new group contracts. [2] Total new settled-for ordinary sales in Canada. [3] Total sales figure does not include sales for Northwest Territories. [4] Under new or amended contracts.

Note: Components may not add to totals due to partial revisions.

[1] End of period. [2] Excluding Treasury Bills, Canada Savings Bonds and other non-market issues. [3] Figures are subject to revision. Series cover all publicly announced issues and some private placements not publicly announced. Notes with an original term to maturity of over one year. [4] Includes Canadian Pension Plan series bonds issued by the provinces and their agencies and purchased by the C.P.P. Investment Fund. [5] Consists of issues of Canadian religious and other institutions and Canadian dollar issues of foreign debtors. [6] Allowance for the take-over of Nova Scotia Light & Power common shares.

[1] The number of stocks included has varied over the period; the totals shown in the column headings represent the current coverage. [2] The headings for "base metals" and "industrial mines" are not found in the Standard Industrial Classification. [3] Combines the industrials, utilities and finance common stocks. [4] Stocks included in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. [5] Includes also the machinery industries (except electrical machinery) and the transportation equipment industries. [6] Stocks included in the mining index are for producing mines.

[1] This statement includes only receipts relating to budgetary revenue. Excluded are non-budgetary revenues such as Old Age Security Fund taxes, Prairie Farm Assistance Act levies, employer and employee contributions to government-held funds (Unemployment Insurance, Superannuation etc.), interest on government-held funds, and taxes collected on behalf of and transferred to other governments. [2] Beginning in December 1973, this category includes oil export tax [3] March includes supplementary payments arising from the closing of the accounts. (continued from page 8)

families with heads unemployed. During both reference years, average income for families with members other than the head unemployed were larger than average income for families with members experiencing no unemployment. This situation, which applies both at the national and regional levels, is due mainly to differences in the age mix of families. Families with members other than the head unemployed have both the largest proportion of families headed by persons aged 35 to 54 years, the age group within which earnings are typically high, and a comparatively greater number of income recipients.[7]

Since the head of a family is usually the primary earner, his or her unemployment affects family income more seriously than unemployment of other family members. Table 4 shows that in both 1971 and 1973, families with heads unemployed had an average income much lower than that for all families. The differentials are 27.1 percent and 24.6 percent for 1971 and 1973 respectively. However the overall income share of the head in total family income dropped from 76.5 percent in 1971 to 74.8 percent in 1973, for all families considered together.

Table 4 indicates that families with unemployed heads have benefited more from increased government transfers than any other group of families. For these families, transfer payments accounted for 10.4 percent of total income in 1971, and 15.3 percent in 1973. The accompanying chart further illustrates the role of transfers in incomes for this group. Table 4 also shows that families in the Atlantic and Quebec regions with unemployed heads have benefited more from transfer payments than have their counterparts in the other three regions of Canada.[8]

Conclusions

The data presented with this paper show that while improved labour market conditions in 1973, as compared with 1971, reduced the overall incidence of unemployment and increased the average level of income in Canada, there was at the same time an improvement in the situation for the unemployed. Average income for those experiencing some unemployment in 1973 was 23 percent higher than 1971, with average transfer payments alone increasing by 102.7 percent. In comparison, the average income for an individual who experienced no unemployment in 1971 or 1973 increased by only 15.8 percent. In relative terms, therefore, the economic circumstances of the unemployed improved between 1971 and 1973.

The families who benefited most from the increased flow of transfer payments were those whose heads were unemployed. By region, such families living in the Atlantic provinces and Quebec received relatively more government assistance than those residing in the other three regions. Overall, however, the family head's share in total family income has declined over this two year period.

---

[7] For 1971, such differences are further substantiated in "Incomes of Unemployed Individuals and Their Families, 1971," Cat. 13-552, pp. 29-30 and 76-77.

[8] It should be noted that such payments also depend on the number of children and certain other characteristics of the family. These effects have not been separated out here.

Appendix

Definitions

An individual is considered to have *experienced some unemployment* if he or she had no work and looked for work for one or more weeks during a given year, and received some money income during that year.

The *incidence of unemployment* for any group of individuals in the labour force is the proportion of that group who experienced some unemployment, in percentage terms.

The *participation rate* for any group of individuals in the population aged 14 years and over is the proportion of that group who are in the labour force, in percentage terms.

Earned income or *earnings* is the sum of wages and salaries and net income from self-employment.

Transfer payments consist of all social security payments from municipal, provincial, and federal governments such as Old Age Security, Guaranteed Income Supplements, pensions under the Canada and Quebec Pension Plans, unemployment insurance benefits, Workmen's Compensation, training allowances, mother's allowances, and pensions to the blind and disabled. In the SCF, family and youth allowances are treated as part of the income of the father or guardian, although legally the payments go to the mother.

Total money income consists of wages and salaries, net income from self-employment, investment income, government transfer payments, and other miscellaneous income. Money income is reported gross of taxes. Income in kind is excluded, as are receipts of gifts, lump sum settlements from insurance policies, income tax or pension refunds, capital gains and losses, and receipts from the sale of assets.

Total family income consists of money income received by all members of a family during a given year.

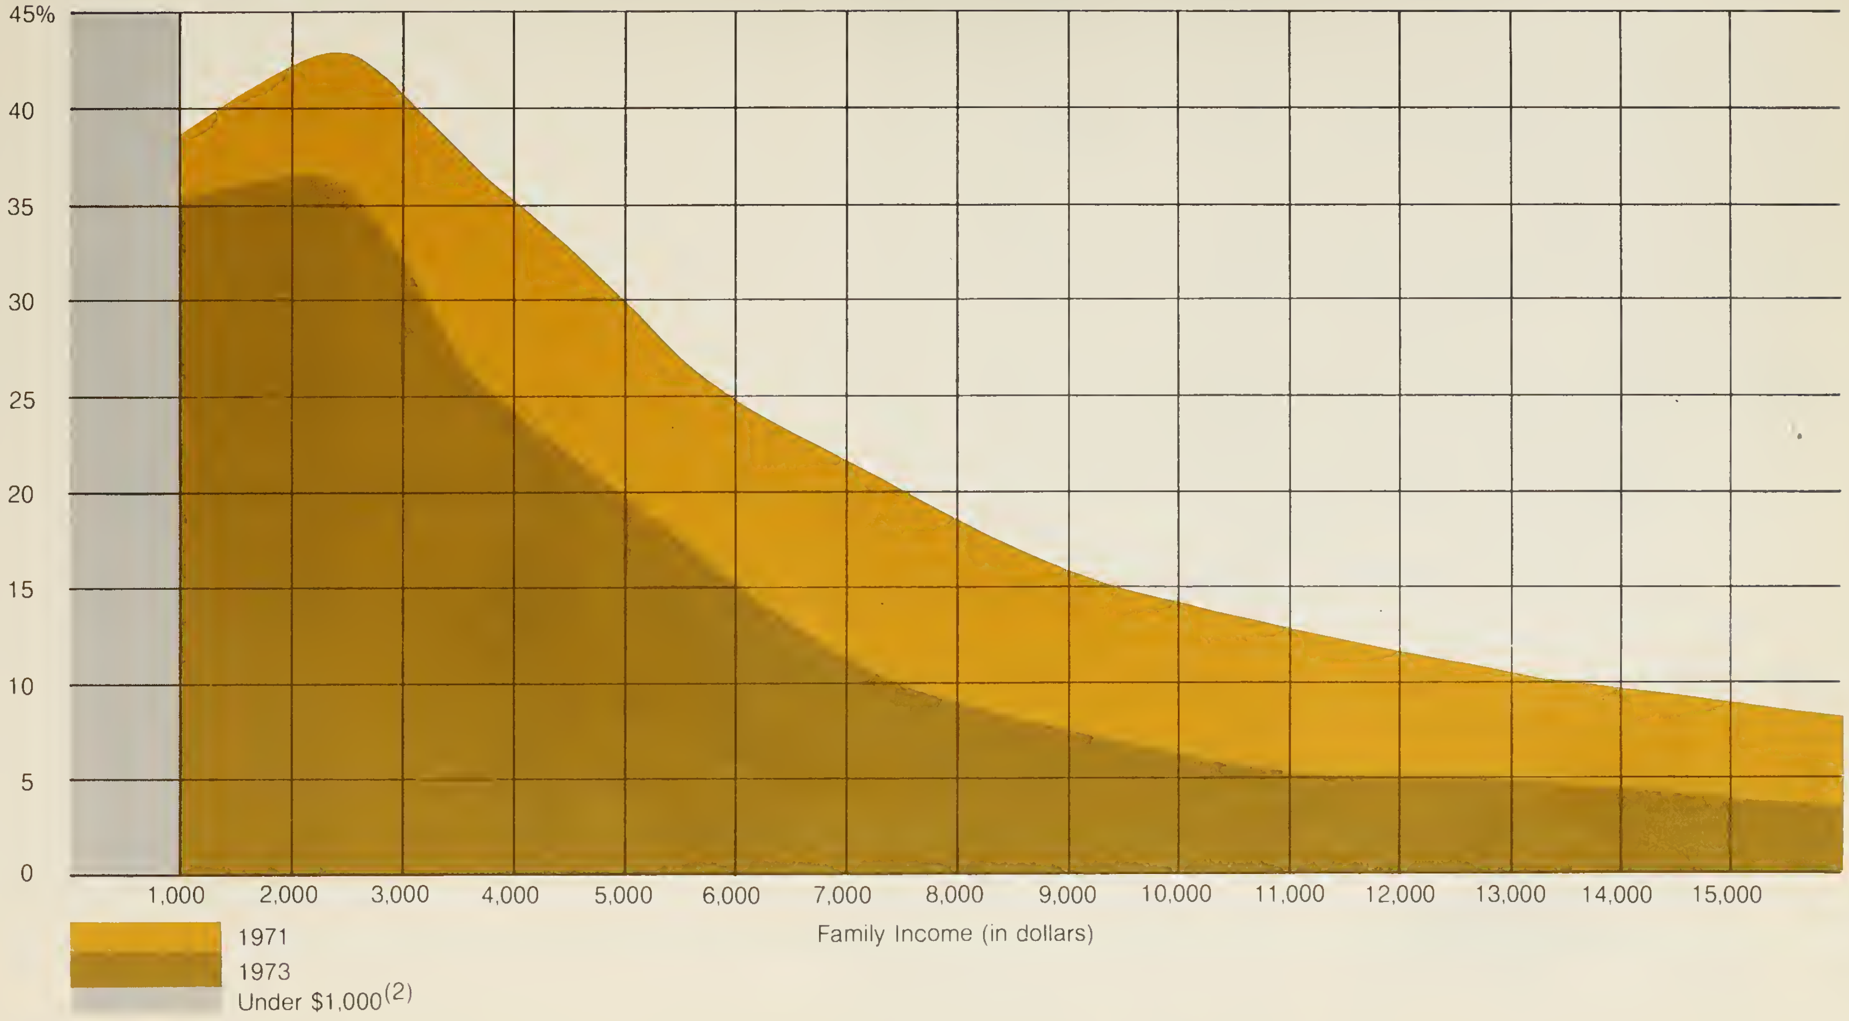
A *family* is defined as a group of individuals sharing a common dwelling unit and related by blood, marriage, or adoption.

A *child* is defined as an individual aged 14 years or more who is related to the family head as son/son-in-law or daughter/daughter-in-law. The classification of an individual as "child" is based on his or her relationship to the family head, and not on his or her age.

An *unattached individual* is defined as a person living by himself or herself, or rooming in a household where he or she is not related to other household members.

The *family head* is defined as the husband in families consisting of married couples with or without children. In single-parent families with married children, the member who is mainly responsible for the maintenance of the family is defined as the head. In single-parent families with unmarried children, the parent is defined as the head. In families where relationships are other than husband-wife or parent-child, the eldest in the family is normally defined as the family head.

Proportion of Transfer Payments in Total Income for Families with Heads Unemployed (1) by Income Groups, Canada, 1971 and 1973



(1) Includes all families whose heads had experienced some unemployment during the reference year regardless of the unemployment experience of other family members.

(2) The proportion of transfer payments in total income for families under $1,000 could not be plotted largely because these families consisted of those who had either positive income under $1,000, zero or negative income during the reference year. This mix of families resulted in a proportion of transfer payments too large to show any meaningful interpretation.

Source: Unpublished data from the 1971 and 1973 SCF.

[1] All individuals who reported earnings in 1971 and 1973 respectively. Total earnings consist of wages and salaries and net income from self-employment.

[2] An individual is considered to have experienced unemployment if he or she had no work and looked for work at least for one week during a given year. On the other hand, an individual who had not experienced any unemployment may or may not have worked for all 52 weeks of the year.

[3] Refer to Appendix for definition of transfer payments, individual's total income and family's total income.

[1] An individual is unemployed if he or she had no work and looked for work for one or more weeks during a given year and had received some money income during that year.

[2] All persons aged 14 years and over who reported some money income and who were sons, daughters, sons-in-law or daughters-in-law of the head of the family are classified as children.

[3] 'All individuals' include other family members not separately shown. Their sample sizes are 182 and 161 for the year 1971 and 1973 respectively. The corresponding estimated numbers are 44,000 and 42,000.

[4] Incidence of unemployment among individuals in the i-th group is calculated by dividing the number of individuals unemployed by number of individuals in the labour force.

[1] Incidence of unemployment among individuals in the i-th group is calculated by dividing the number of individuals unemployed by number of individuals in the labour force.

[2] Calculated by dividing the total earnings contributed (or total transfer payments received) by one or more unemployed children in a family by their total family income.

[3] Calculated by dividing the total earnings contributed (or total transfer payments received) by one or more unemployed individuals in a family by their total family income.

[4] Sample too small for reliable estimates.

Canadian Statistical Review

Data in this publication were retrieved from CANSIM® (Registered Trade Mark of Statistics Canada for its Canadian Socio-Economic Information Management System), and processed to create a photo-ready copy from which this publication was produced. CANSIM is the Statistics Canada computerized data bank; series published in this Review (as well as other data) are available on computer printouts, cards, tape or directly via terminal.

The identification numbers at the top of each column of data refer to the unadjusted and seasonally adjusted monthly or quarterly data in this column. Series maintained by Statistics Canada carry a "D" prefix (e.g. D 1375). The "B" prefix (e.g. B 1437) identifies series in CANSIM which are maintained by the Bank of Canada.

More details on which data is available can be found in the following:

CANSIM Summary Reference Index (Annual with periodic amendments) – Free on request.

This index is a summary of the data in CANSIM. It provides a key to the Series Directory and is the first step in locating and ordering series from the CANSIM Main Base.

CANSIM Main Base Series Directory (Annual with periodic amendments) – $30.

This Directory is a detailed guide to the data on the CANSIM Main Base. It gives the title, start date, source of the data, and other descriptive material. The Directory is published in three volumes.

CANSIM Mini Base Series Directory (Annual with periodic amendments) – $10.

This Directory is a detailed guide to the data on the CANSIM Mini Base – a standard subset of data originating from the CANSIM Main Base which is available at various Secondary Distributors.

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used in Statistics Canada is the U.S. Bureau of the Census Method II, X-11 variant. Seasonal adjustment removes the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing.

While seasonal adjustment allows a much better look at the underlying trend of a series, the adjusted series will contain irregular fluctuations. Small changes between months in the adjusted series may simply be erratic movements and, to obtain a clearer idea of the underlying trend, users should examine the adjusted series over a number of months. The MCD, or Months for Cyclical Dominance, in a table containing seasonally adjusted series, indicates the smallest span of months for which the average percent change without regard to sign in the trend cycle is greater than that in the irregular factor. For the smoothest series in MCD is 1, for the most erratic series it is 6. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.

Editorial Board

This publication is produced under the guidance of the Canadian Statistical Review Editorial Board, composed of the following Statistics Canada staff members:

G. Leclerc (Chairman) – Assistant Chief Statistician, Economic Accounts and Integration Field
V. Berlinguette – Assistant Chief Statistician, Business Statistics
R.E. Drover – Director, User Advisory Services Division
F. Emmerson – Co-ordinator, Financial Statistics
B.J. Lynch – Director, Prices Division
R. Platek – Director, Household Surveys Development Staff
J.R. Podoluk – Director General, Household Statistics Branch
J. Randall – Director, Financial Flows and Multinational Enterprises Division
L.O. Stone – Senior Advisor, Population Studies and Statistics, Census
P.N. Triandafillou – Director, Current Economic Analysis Division
J.S. Wells – Director General, Gross National Product Division
Dr. M. Wisenthal – Director General, Institutions and Public Finance Branch
G. Bériault-Prud'homme – Editor, Canadian Statistical Review

Inquiries about the contents of the Canadian Statistical Review should be directed to the editor at : Current Economic Analysis Division, 23rd. Floor, Section M, R.H. Coats Bldg., Tunney's Pasture, Ottawa, Ontario, K1A 0T6.

Subscriptions

The *Canadian Statistical Review* and other catalogued publications of Statistics Canada, including a free annotated catalogue of current publications, may be ordered from Publications Distribution, Statistics Canada, Ottawa, K1A 0T6 and remittances made payable to the Receiver General for Canada.

A weekly supplement containing data published between release dates of this review is distributed free of charge to all subscribers.

Historical data for selected economic indicators, both adjusted and unadjusted for seasonal variation, are distributed to subscribers in an Annual Supplemment.

Correspondence should be directed to the *Canadian Statistical Review,* Current Economic Analysis Division, Statistics Canada, R.H. Coats Tower, Ottawa, Ontario, K1A 0T6.

Note to Users

This section is used to announce changes in tables of the *Canadian Statistical Review* and in related CANSIM series.

Section 2, Table 5 to 7 – Births, Deaths and Marriages

With this issue the series Yukon and the North West Territories have been added to these tables at the request of the source.

Section 9, Table 1 – Farm Cash Receipts

A new series entitled Provincial Stabilization Program has been introduced with this issue.

National Income and Expenditure Accounts

Second Quarter 1976 – Advance Information

Gross National Product, seasonally adjusted at annual rates, increased 3.3 per cent in the second quarter to a level of $182.9 billion; after adjustment for price changes, real GNP was unchanged from the first quarter. This followed a very large 2.7 per cent real increase in the first three months of the year, and the economic recovery thus appeared to slow somewhat. The slowdown in real growth should not be interpreted as a signal that the recovery is about to abort however, because it was entirely the result of a substantial swing to inventory liquidation from last quarter's massive accumulation. It was apparent at the time of the first quarter that stock building could not be maintained at that rate, and this quarter's inventory swing was not entirely unexpected. About $1560 million (at annual rates) in real inventories were accumulated in the first half as a whole, which is in the range that could be expected at this stage of the recovery. The average rate of real growth for the first half, with the distorting effects of the inventory movements very nearly cancelling themselves out, was a respectable 1.3 per cent.

Inventory movements aside, the economic picture brightened in the second quarter. Growth in real final domestic demand – that is, gross national expenditure plus imports minus exports and inventories – increased to 1.1 per cent from 0.6 per cent in the first quarter. The recovery broadened its base considerably, as continuing strong external demand and a slowdown in import growth brought about the long awaited improvement in the balance of trade, and personal expenditure returned to healthy growth after a relatively weak first quarter.

Personal Expenditures

Personal expenditure on goods and services increased 3.3 per cent to a level of $106.3 billion in the second quarter. In real terms, consumption grew 1.7 per cent, following a minimal 0.6 per cent increase in the first three months of the year. The recovery in personal expenditure was primarily the result of a strong 5.4 per cent rise in spending on durables, which had declined 7.5 per cent in the first quarter. Fluctuations in automobile sales were largely responsible for both quarterly movements; although purchases of new passenger vehicles increased by a considerable 15.1 per cent in the second quarter, this did not completely offset the previous decline and car purchases were still well below the record fourth quarter level. Expenditure on semi-durables grew 1.6 per cent in real terms, which was roughly the same rate of change as last quarter. Real growth in both non-durables and services, however, slowed from the first quarter. The deceleration in non-durable expenditure to a 1.3 per cent increase was mainly brought about by a decline in real spending on gasoline and by slower growth in expenditure on food, while a decline in spending on foreign travel and financial services caused growth in services to slow to 0.6 per cent.

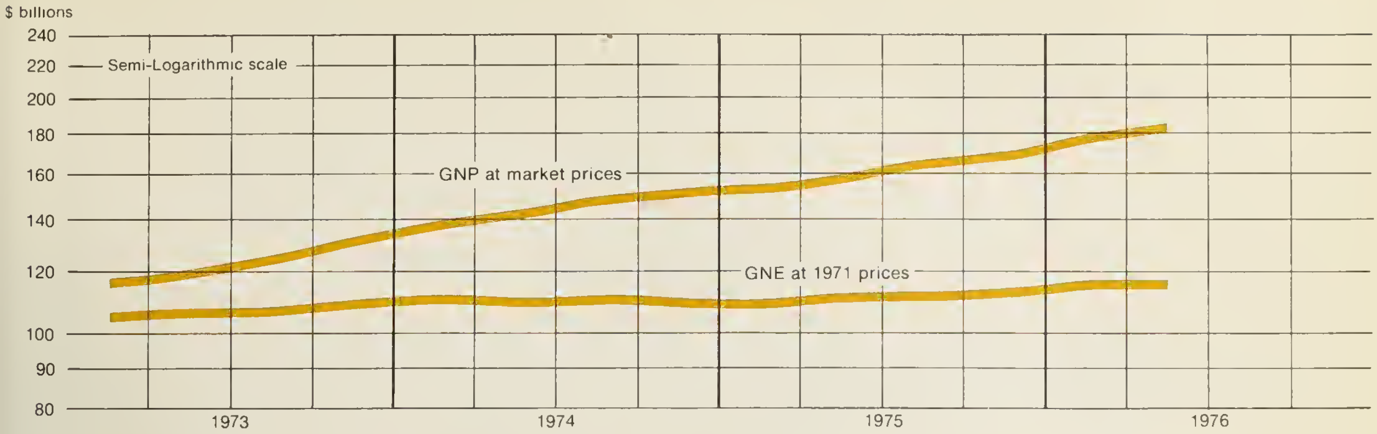
Fixed Capital Formation

Gross fixed capital formation rose 3.2 per cent in the quarter, but most of this was due to price increases and total fixed investment increased only 0.9 per cent in real terms. Residential construction remained the strongest component of investment and grew 2.6 per cent in real terms, as work put in place on row and apartment units offset a small decline in construction of single family dwellings. Business real investment in non-residential construction fell 0.9 per cent as a result of a decline in construction of non-residential buildings; engineering work, however, showed some strength. After falling for two consecutive quarters, business real investment in machinery and equipment rose 1.6 per cent. This was due in large part to an increase in purchases of vehicles used for commercial purposes, although there were also increases in both imports and domestic shipments of other machinery and equipment.

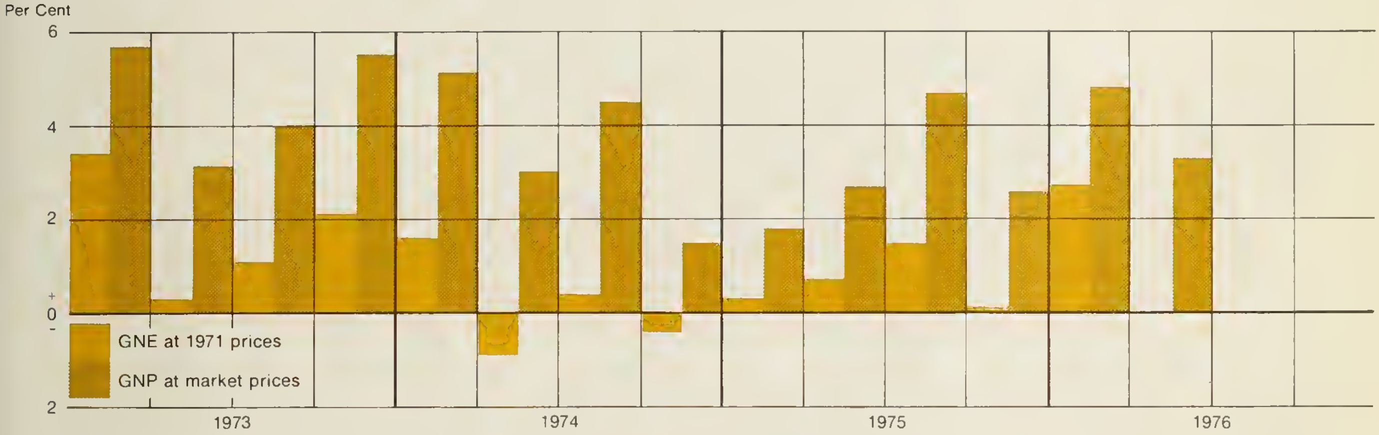
Inventory Investment

The value of the physical change in inventories fell to $-280 million in real terms in the second quarter after an accumulation of $1840 million in the first.

Gross National Product, seasonally adjusted at annual rates, increased 3.3% in the second quarter to a level of $182.9 billion; after adjustment for price changes, however, real GNP was unchanged from the first quarter.

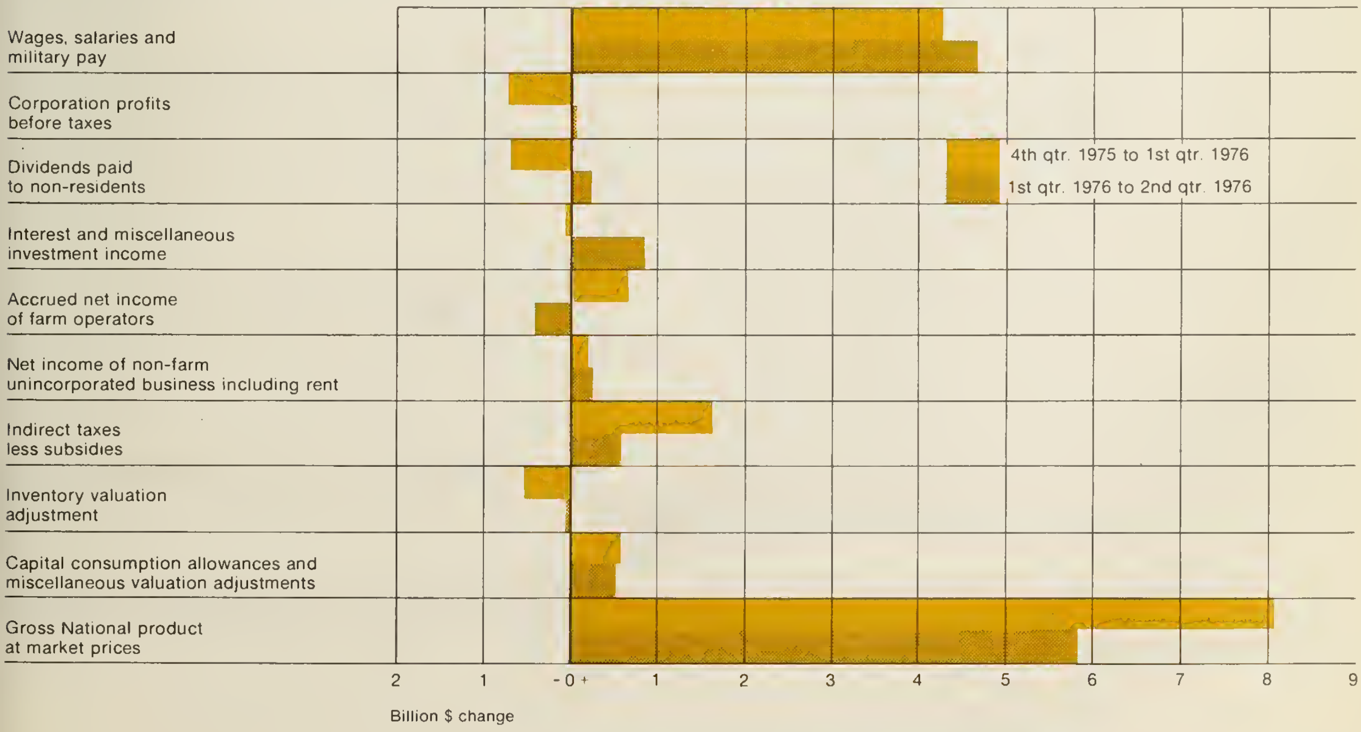


Quarter-to-Quarter Change



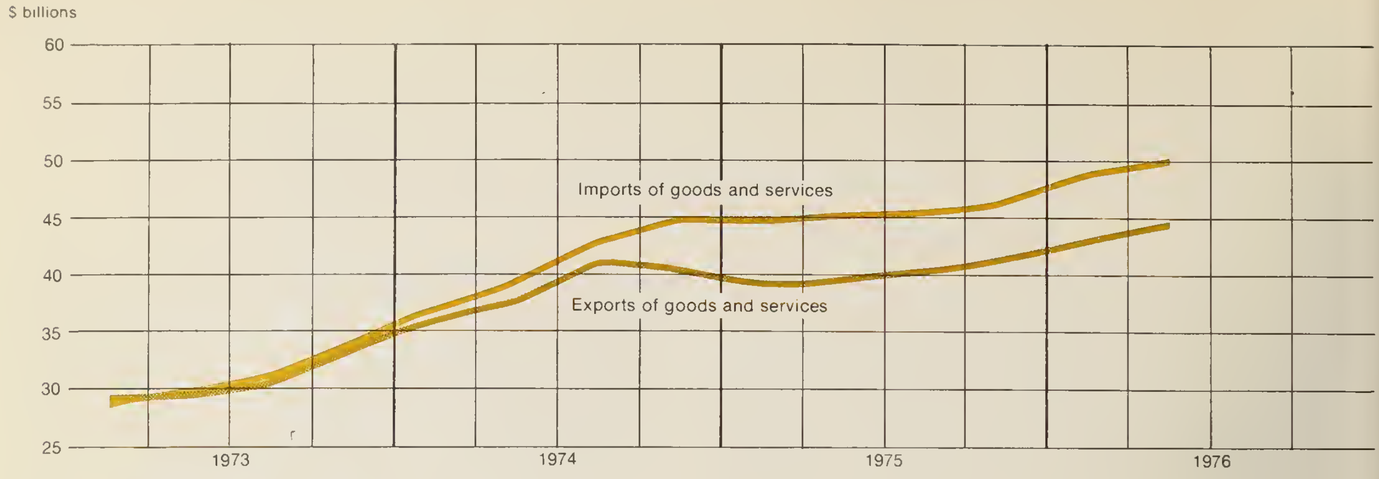
Wages, salaries and supplementary labour income grew 4.7%, but almost half of the increase was due to retroactive wage payments. Profits were virtually unchanged after falling 3.9% last quarter.

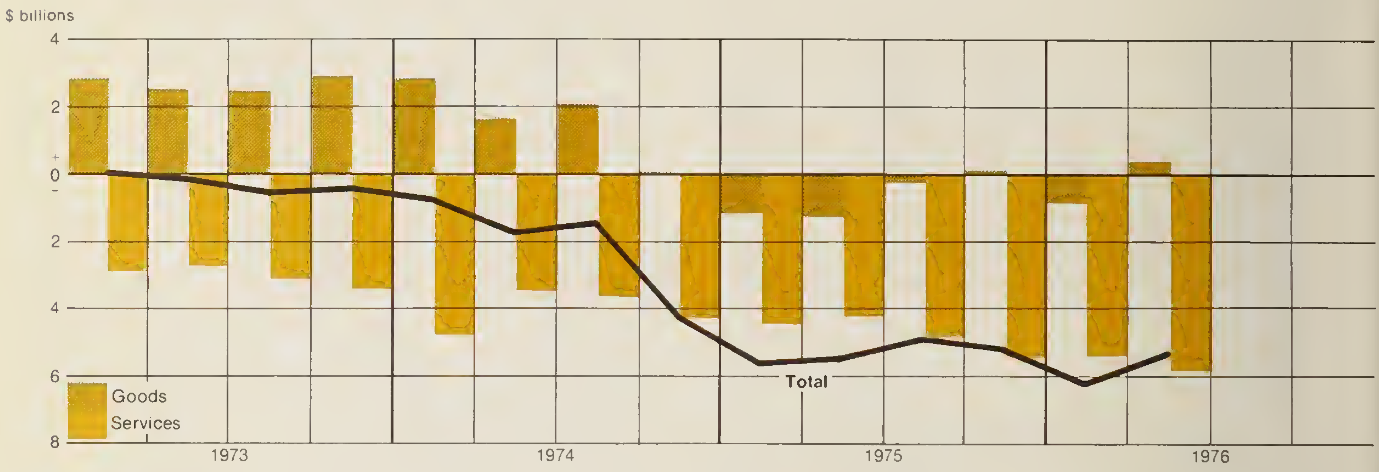
Quarterly changes in GNP and components



All quarterly data adjusted for seasonal variation and at annual rates.

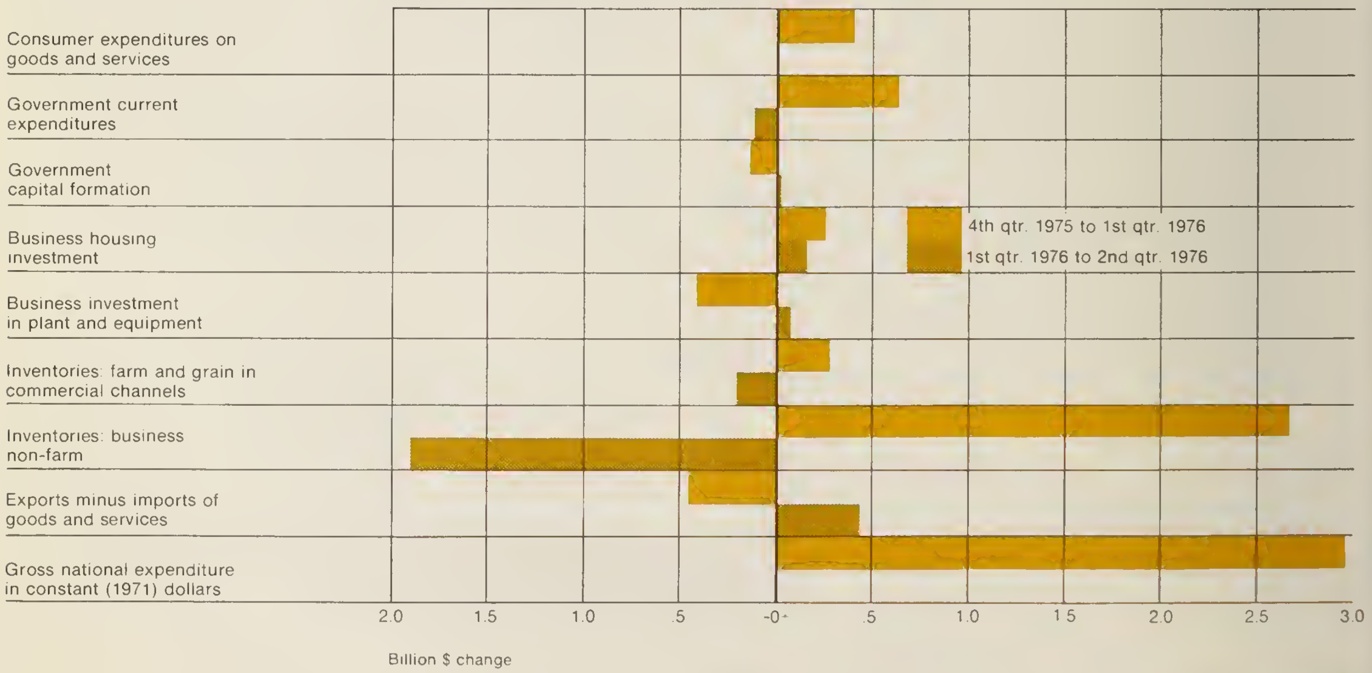
Exports continued to grow rapidly and the trade balance improved by about $800 million at annual rates.





The apparent slowdown of the recovery was due entirely to a swing back to inventory liquidation after last quarter's massive accumulation of stocks. Personal expenditure returned to healthy growth and final domestic demand strengthened.

Quarterly changes in GNE and components in constant (1971) dollars



All quarterly data adjusted for seasonal variation and at annual rates

(continued on page 143)

OBSERVATIONS

North American Conference on Labour Statistics

The North American Conference on Labor Statistics was held in Ottawa from July 26 to 29, 1976. The Conference was sponsored by the U.S. Department of Labor, the Bureau of Labor Statistics, Statistics Canada, Canada Manpower and Immigration, and Labour Canada.

Some of the items discussed were: occupational information needs; local area unemployment statistics program; revised price indexes; Canadian and U.S. policy perspectives on employment problems; and recent developments in seasonal adjustment methods and application.

Canadian Mortality

The Vital Statistics Section has recently published a report dealing with general mortality according to principal cause. The tables and charts of the report outline the changes in Canadian mortality over the period 1950-1972.

The first set of tables deals with mortality from all causes over the period. The second section of tables presents a detailed analysis of mortality from six leading causes, at the provincial level. The third group of tables shows the changes in Canadian mortality from a larger number of important causes, at the national level.

The fourth group of tables presents a detailed breakdown of Canadian mortality during 1972. Finally, Canadian mortality rates by principal cause are compared with the corresponding rates in selected foreign countries, for a recent year.

The appendices present the results of a rank correlation test, which was applied to a large number of series to determine whether there was a significant positive or negative trend.

General Mortality 1950-1972 (Catalogue 84-531) is available for $2.10 from Publications Distribution, Statistics Canada, Ottawa, K1A 0T6.

Inquiries about the contents of this publication may be directed to Dr. J. S. Cudmore, Health Statistics Division, Statistics Canada, Ottawa, K1A 0T6 (613-995-0864).

Shopping Centres

Shopping Centres in Canada, 1951-1973 is the first of a series of reports which will describe and analyse those key elements in Canada's distributional system having the greatest impact on its citizens in the performance of their activities as producers and consumers of goods and services.

In simple terms, distribution has been defined as "the performance of business activities that direct the flow of goods and services from producer to consumer or user". These research papers will focus on the institutions which are primarily engaged in the retailing and wholesaling activities rather than on organizations that facilitate the efficient functioning of the distributional system (banks, insurance companies, advertising agencies, railroads and trucking companies, etc.).

Institutions in the distributional process cause or react to changes in their environment. Modifications in population size, income distribution, governmental legislation, product lines, as well as consumer attitudes and behaviour, are a few of the many interrelated factors which affect the character of the institutions that are involved in the movement of goods and services. These organizations must react and adapt to the continually changing milieu in which they exist or simply wither away.

Consequently, in undertaking this series of research papers, Statistics Canada will attempt to identify and describe the underlying factors which have influenced the distributional system, to analyse changes in the elements of this system and to determine their present as well as future roles in the Canadian economy.

This first report examines the development of shopping centres in Canada during the period 1951-1973. It also provides an historical summary of the development of the shopping centre concept since the beginning of the century in the United States and Canada.

The scope of the study covers the impact of shopping centres on canadian retailing; the effect of shopping centres on regional retailing; the types of shopping centres in Canada; and, the future of shopping centres in Canada.

The appendix provides a list of definitions serving as sources of reference for the statistical data presented in the report. It also contains a list of shopping centres in Canada and a list of chain stores organizations located in shopping centres.

Shopping Centres in Canada, 1951-1973, (Catalogue 63-527) can be obtained from Publications Distribution, Statistics Canada, Ottawa, Ontario, K1A 0T6. Price: $1.40.

Inquiries about the contents of this publication may be directed to Mr. G. Snyder, Merchandising and Services Division, Statistics Canada, Ottawa, Ontario, K1A 0T6 (613-996-9295).

Homicide in Canada

A special study of homicide in Canada has been prepared by the Justice Statistics Division; it is a product of their Homicide Program. *Homicide in Canada: A Statistical Synopsis* presents a detailed factual picture of murder and manslaughter in Canada since 1961 and how our institutions respond to such occurrences. A review of the historical foundation and development of the law of homicide in Canada has been included as an appendix. For the readers who might wish to have additional statistical information or material pertaining specifically to legal aspects of murder and other types of homicide, a short list of sources of such information is presented in a Selected Bibliography at the end of the report.

Homicide in Canada: A Statistical Synopsis (Catalogue 85-505E) is available for $2.80 from Publications Distribution, Statistics Canada, Ottawa, Ontario, K1A 0T6.

For further information regarding this publication, contact Mr. Paul Reed, Assistant Director (Research), Justice Statistics Division, Statistics Canada, Ottawa, Ontario, K1A 0T6 (613-995-0746).

Family Migration

Family Migration is one of a special series of reports designed to focus on materials of specific interest which are not dealt with in the Volume Series of the Census Publication Programme.

This report presents 1971 Census statistics on family migration in Canada. The designation of a person's "migration status" was derived from responses to a question relating to place of residence five years ago, that is, on June 1, 1966. Persons were classified as "non-movers" if living in the same dwelling on June 1, 1971 as five years previously, and as "movers" if they were enumerated in a different dwelling in 1971. Movers were further classified according to the magnitude of their move (within same municipality, from different municipality, etc.).

Six tables are presented in the report: Tables 1 and 2 show the migration behaviour of all families. Further breakdowns by family status and age of family head allow the researcher to compare migration status of heads at various stages of family life-cycle processes. The universe of husband-wife families is dealt with in Tables 3 and 4. Using the combined responses to census questions on migration status and date of first marriage, it is possible to isolate those families in which family formation and dissolution processes are not a factor in the decision to migrate. Family formation (usually by marriage) and dissolution (divorce, death of spouse, etc.) precipitate much migratory activity. However, by selecting husbands and wives who have the same date of first marriage prior to 1966, the migration behaviour during the 1966-1971 period, of those husband-wife families which existed over the entire period can be observed. The migration characteristics of one-parent families are shown in Tables 5 and 6.

Geographic areas for which figures are presented are: Canada and the provinces (Tables 1, 3 and 5); the Census Metropolitan Areas (Tables 2, 4 and 6).

Family Migration (Catalogue 93-771 (SF-1)) is available for $1.50 from Publications Distribution, Statistics Canada, Ottawa, K1A 0T6.

Inquiries about the contents of this report may be directed to Mr. Brian Harrison, Census Characteristics Division, Statistics Canada, Ottawa, Ontario, (613-994-5120).

Public General and Allied Special Hospitals

Public General and Allied Special Hospitals in Canada: Historical Summary of Inputs and Utilization of Facilities 1953 to 1973 presents an overview of the hospital industry as a component of the Canadian economy.

Prepared by the Hospitals Section, this research paper is a structured historical summary of the hospital sector over the last two decades. Numerical times series and charts have been used to analyse trends in order to illustrate the development of some of the main components of the hospital sector over the last twenty years.

---

[1] The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. [2] Includes logging, fishing, trapping and hunting. [3] Includes mechanical and construction. [4] Includes a small number in non-specified occupations. [5] Does not include students entering Canada on students' visas. [6] Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force.

Section 3 · System of National Accounts

1. Income and Expenditure Accounts

28 1.1 National Income and Gross National Product
28 1.2 Gross National Expenditure, Current Dollars
29 1.3 Gross National Expenditure, Constant Dollars
29 1.4 Sources of Personal Income
30 1.5 Disposition of Personal Income
30 1.6 Sources and Disposition of Gross Savings
31 1.7 Government Revenue, Expenditure, and Surplus of Deficit, by Level of Government
35 1.8 Implicit Price Indexes
35 1.9 Relation between Gross National Product at Market Prices and Gross Domestic Product at Factor Cost

2. Domestic Product by Industry

36 2.1 Real Domestic Product by Industry of Origin, Quarterly
37 2.2 Real Domestic Product by Industry of Origin, Monthly

3. Balance of International Payments

42 3.1 Canadian Balance of International Payments, Current Account, All Countries
42 3.2 Canadian Balance of International Payments, Current Account, Country Distribution
43 3.3 Canadian Balance of International Payments, Capital Account, All Countries

1–Income and expenditure accounts

Table 1.1: National income and gross national product (millions of dollars)

Year and quarter	Wages, salaries, and supplementary labour income	Military pay and allowances	Corporation profits before taxes[1]	Deduct: dividends paid to non-residents[2]	Interest & misc. investment income[3]	Accr'd net income of farm operators from farm prod.[4]	Net income of non-farm un-incorp. business incl. rent[5]	Inventory valuation adjust.[6]	Net national income at factor cost	Indirect taxes less subsidies	Capital consump. allowances & misc. val. adj. [1] Excludes profits (net of losses) of government business enterprises. [2] Includes the withholding tax applicable to this item. [3] Includes profits (net of losses) of government business enterprises and interest and miscellaneous investment income of government. [4] Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. [5] Includes net income of independent professional practitioners. [6] See footnote 4, Table 1.2.

[1] Includes defence expenditures. [2] Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. [3] Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals and business investors. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. [4] The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment, (as shown in Table 1.1). [5] See footnote 4, Table 1.1.

---

[1] The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

[1] Includes the taxes on life insurance companies introduced in 1969. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals in so far as their investment activities are concerned. The 1969 taxes are thus included here pending a complete review of the treatment of insurance [2] Excludes the special refundable tax on corporations introduced in May 1966. Refunding of the tax began in 1968. [3] Withholding taxes. [4] The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four. Since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series

For source see Table 1.9.

---

[1] These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change

For source see Table 1.9.

Table 1.9: Relation between gross national product at market prices and gross domestic product at factor cost (millions of dollars)

Year and quarter	Gross national product at market prices	Deduct:			Add		Gross national product at market prices	Deduct:			Add:	
		Residual error of estimate	Indirect taxes less subsidies	Investment income received from non-residents	Investment income paid to non-residents	Gross domestic product at factor cost		Residual error of estimate	Indirect taxes less subsidies	Investment income received from non-residents	Investment income paid to non-residents	Gross domestic product at factor cost

---

[1] The labour force as a percentage of the population 15 years of age and over The participation rate for a particular group (age, sex etc.) is the labour force in that group expressed as a percentage of the population for that group [2] The unemployed as a percentage of the labour force The unemployment rate for a particular group (age, sex etc.) is the unemployed in that group expressed as a percentage of the labour force for that group Seasonally-adjusted rates are calculated by dividing seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and seasonally-adjusted unemployment (i.e seasonally-adjusted labour force by summation).

Note: Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error In general, the smaller the estimate, the larger is the relative sampling error For other explanatory material see notes at the end of Catalogue No. 71-001

[1] A vacancy rate is obtained by expressing the number of vacancies per thousand existing jobs (sum of vacant and filled jobs) in all industries, except agriculture, fishing and trapping, domestic service and the non-civilian component of public administration and defence. Both full-time and part-time jobs are included. [2] Includes Prince Edward Island and the Yukon and Northwest Territories for which separate reliable estimates are not available. [3] Due to postal strike the mail sample was reduced. These estimates should be used with caution due to their reduced reliability.

[1] In calculating time lost, only the workers directly affected by the strike or lockout are taken into account: time lost by workers indirectly affected, such as those laid off as a result of a work stoppage, is not included. [2] The industry groups prior to January 1973 are based on the 1960 Standard Industrial Classification. From January 1973 forward, the 1970 S.I.C. is used. [3] The number of man-days is calculated by multiplying the number of workers involved in a work-stoppage by the number of normal working days during the stoppage. Adjustments are made for establishments on shift work, etc. [4] The statistics for individual industries exclude strikes and lockouts involving fewer than 100 workers; however, the total includes all work stoppages. The agriculture, finance, insurance and real estate and public administration and defence industries are not shown separately. Should strikes occur in these industries, the time lost also will be shown in the total. In addition, the total is revised quarterly whereas the individual categories are revised annually. [5] Includes miscellaneous manufacturing industries. [6] Includes publishing and allied industries. [7] Includes storage and communication industries.

[1] The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below [2] Excludes agriculture, fishing and trapping, education and related services, health and welfare services, religious organizations, private households, public administration and defence. [3] Includes storage, electric power, gas and water utilities. [4] Excludes domestic service.

[1] The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below [2] In addition to those listed, tobacco products, knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing

---

[1] These rounded weights, provided as a general guide, show the relative importance of the major components of the C.P.I., on average, during the year 1974. [2] Includes shelter and household operation. Until April 1973, the shelter element of regional cities' housing indexes moved on the basis of changes in rents only. However, from May 1973 on home-ownership has been included in the shelter element of regional cities' housing indexes, so that the Canada and regional cities' shelter indexes now contain the same elements.

---

[1] Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments, for these a monthly estimate of work put in place has been substituted [2] Total new orders received during the period at estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month [3] Total manufacturing inventory owned by manufacturers including warehouse stocks

[1] Starting with January 1968, production is manufacturers' production; prior to that date production was indicated by the use of excise duty stamps. [2] Intended for cigarettes. [3] Includes pipe, plug, chewing, twist, snuff etc. [4] Includes sales to wholesalers or retailers. [5] Subject to Excise Tax [6] Includes sales for ships' stores and for export. [7] End of period.

[1] 100 cu. ft. of solid wood; pulpwood produced for domestic use and excluding exports, but including receipts of purchased roundwood. [2] Total pulp production covers "screenings" which are already included in exports. "Screenings" are excluded throughout from mechanical and chemical pulp. [3] Customs exports. [4] Mill shipments destined for export.

[1] Data compiled according to the Steel Distribution Index revised January, 1964 Figures on net shipments relate to semi finished and rolled steels products only Shipments to consuming industries of castings, forgings and steel pipe are not included. [2] Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities [3] Includes appliances and utensils. [4] Excluding shipments for re-processing at maker's own plant

---

[1] Production plus imports less re-exports, minus exports. [2] Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and distributors) was based on "actual cost to purchaser" rather than the suggested list price as in the past.

Sources: Motor Vehicle Shipments (42-002), New Motor Vehicle Sales (63-007), Trade of Canada, Imports (65-007), Exports (65-004), Statistics Canada.

[1] Gas types are included. [2] Includes producers' shipments for export. [3] In some cases these shipments are not at the factory level, and stocks at beginning of month plus production less shipments do not equal stocks at end of month. [4] End of period [5] Electric and other [6] Excludes apartment type machines. [7] Excludes other than electric. **Sources: Domestic Refrigerators and Freezers (43-001), Domestic Washing Machines and Clothes Dryers (43-002), Trade of Canada, Exports (65-004), Imports (65-007), Statistics Canada.**

[1] These totals include all generating agencies producing over twenty million kilowatt hours per year. [2] These columns include all generating utilities and generating industries respectively, producing over twenty million kilowatt hours per year. [3] Less imports. [4] Total net generation less net exports.

Note: Components may not add to totals due to rounding. Current figures in this table are preliminary and therefore subject to revision. [1] Supply and disposition for both Crude Oil and Natural Gas will not agree because of losses, inventory changes, pipeline fuel used etc. [2] Includes crude oil, condensate and pentanes plus. [3] Gross new production by field less field flared and waste.

---

[1] Barrels of 35 Canadian gallons [2] Includes domestic and imported crude oil, condensate and pentanes plus received by Canadian refineries [3] Refinery production (from crude oil, condensate and pentanes plus, and commingled propane/butane mixes) plus other materials used [4] Includes deliveries of butane commingled in the crude stream in Saskatchewan and Alberta. [5] Includes inventories at end of period being held at gas plants and in storage caverns [6] Includes stove oil, kerosene. [7] Includes aviation gasoline and aviation turbo fuel. [8] Due to conceptual changes, the stock and sales series are not available on a comparable basis prior to June 1965. Includes propane and propane mixes and butane and butane mixes. [9] Includes petro-chemical feed stocks, naphtha specialties, coke, lubricating oil and grease, still gas and other products.

---

[1] A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly.

Note: Components may not add to totals due to rounding differences.

[1] Data are on a gross basis i.e. they do not take account of cancellations or alterations of loans after initial approval.

[2] Agency loans (loans made by other lending institutions on behalf of C.M.H.C.) are included under C.M.H.C.

[3] Includes fraternal and mutual benefit societies, Quebec savings banks and, since May 1967, chartered banks.

[4] Includes new and existing commercial structures and farm property.

[1] In this context, "softwood" refers to wood from coniferous trees, and hardwood to wood from broadleafed species. [2] Includes export shipments, the softwood lumber column includes domestic shipments are somewhat higher. [4] Production for these items. As reported by principal manufacturers. Total production is somewhat higher. [5] Building contractors, public and utility construction and structural steel fabricators.

---

[1] Cash receipts from farming operations excluding supplementary payments. Excludes Newfoundland. [2] Represents participation payments made by the Canadian Wheat Board direct to producers on crops delivered in previous years. [3] Includes rye, flaxseed, rapeseed, soybeans and corn. [4] Includes clover and grass seed, hay, clover, greenhouse, mustard seed, sunflower seed, hops, dry beans and dry peas and miscellaneous products. [5] Made under the authority of the Agricultural Stabilization Act.

Note: Components may not add to totals due to rounding. [1] The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when the current annual totals for all firms are known the following year. [2] The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers.

---

[1] Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of output. Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. [2] 1973 and 1974 price indexes are subject to revision. [3] 1974 price indexes are subject to revision. [4] Farm share only of motor vehicles. [5] In addition to the components listed, the major group includes Building Repairs, Fencing Construction and Repairs, Mortgage Credit, and Farm Rent. [6] In addition to components listed, the major group includes Seed, Custom Work, Artificial Insemination, Small Tools and Supplies, and Electricity.

---

[1] Since January 1975 total milk production has been obtained by adding sales off farms to first receivers (usually marketing boards) and volume used on farms for feeding and farm house consumed. [2] Includes case and bulk. [3] As at end of period. Last month is preliminary. [4] Exclusive of Newfoundland; includes hatching eggs.

[1] Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada. Data shown for the last current year are not so adjusted. [2] Production is calculated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. [3] Includes baking and frying oils and fats. [4] Includes stocks held by manufacturers and other warehouses. [5] Includes fresh sausage, frankfurters, weiners and all other sausage. [6] Includes solid, coated, bulk, packages and novelties. [7] The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of 1970, be collected on the basis of factory sales.

Note: Components may not add to totals due to rounding and partial revisions. [1] Fully secured by marketable bonds and stocks. Excludes loans to finance the purchase of Canada Savings Bonds. [2] Includes loans on the security of household property. [3] Not available on a monthly basis. [4] Includes loans to finance companies which are affiliates of retail merchandisers. [5] Religious, educational, health and welfare institutions. [6] Differs from general loans in Section 13, Table 2 by the exclusion of loans to instalment finance companies.

---

Note. Components may not add to totals because of rounding.

[1] Credit extended mainly to individuals and chiefly for personal consumption expenditures. Data exclude consumer indebtedness arising from residential mortgages, home-improvement loans and bank loans fully secured against marketable securities. Figures do not include statistics on interpersonal loans, bills owing to doctors, dentists, lawyers, and other personal service credit. [2] Conditional sales agreements held by sales finance companies and by consumer loan companies in connection with the financing of retail purchases of consumers' goods and repaid in instalments. Amounts shown exclude unearned finance charges. [3] Personal cash loans of up to $1,500 made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. [4] Personal cash loans over $1,500, usually repaid in instalments. Amounts shown exclude unearned finance charges. [5] Includes bank-sponsored credit card balances. [6] The data for Quebec savings bank loans are not seasonally adjusted as no seasonality is present: this series is repeated in the unadjusted form. [7] Amount owed by personal (non-commercial) credit card holders to oil companies, airlines, auto-rental firms, and international travel and entertainment credit card issuing companies. [8] Bills due for non-commercial use of telephones, gas and electric power. [9] Personal cash loans only. The data for mortgage and trust companies are not seasonally adjusted because there are not yet enough data to determine a pattern of seasonality: this series is repeated in the unadjusted form.

[1] Column numbers refer to tables 3 and 4 section 11. [2] Includes special transaction-trade, not shown separately. [3] The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. [4] Revisions made to ensure consistent coverage. The most important are: Farm machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc.

[1] Column numbers refer to tables 3 and 4, section 11. [2] The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. [3] Includes special transaction-trade, not shown separately. [4] Includes scrap. [5] Some series such as General purpose machinery have been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) now include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. **Source: Trade of Canada Imports (65-007), Statistics Canada.**

Section 12 · Transportation

130 1. Carloadings of Revenue Freight
131 2. Railway Operating Statistics
131 3. Operating Statistics of Canadian Air Carriers
132 4. Operating Statistics of Canadian Pipelines
132 5. Shipping Traffic

Table 1: Carloadings of revenue freight on Canadian railways[1] (thousand cars)

Year and month	Total railway revenue freight loadings (carload and non-carload) ('000 tons)		Total revenue cars loaded (carload only)	Farm products and food						Mine products			
	unadj.	S.A.		Wheat	Other grain and grain products	Fresh fruits and vegetables	Other agriculture products	Animals and their products	Prepared food products	Iron ore and concentrates	Other metal ores and concentrates	Potash	Coal, sand, cement and other mine products

[1] Beginning with 1970, figures include the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Transair) normally account for approximately 85 per cent of the total revenues and expenses reported by Canadian commercial air carriers. [2] Cargo includes air freight and express but excludes mail and excess baggage.

[1] Bank of Canada deposits are averages of the juridical days in the month shown while Bank of Canada notes and Canadian dollar deposit liabilities are averages of the 4 consecutive Wednesdays ending with the second last Wednesday in the previous month. [2] Daily averages for period. [3] Mainly deposits of foreign banks. [4] Capital, rest fund and undivided profits as at the latest fiscal year-end. [5] Including issues payable in foreign currency [6] Excluding Canadian day-to-day loans. [7] Securities purchased direct from issuer with a term of less than one year at time of issue are classified as loans. [8] Loans to grain dealers and exporters. [9] Loans to finance purchase of Canada Savings Bonds at time of issue [10] Including loans to instalment finance companies [11] These series reflect the combination of two CANSIM series.

Note: Components may not add to totals because rounding [1] This series was designed to cover 50 clearing house centres. With the advent of centralized data processing, bank clearing houses have been eliminated. The current allocation of cheques cashed continues to reflect what had been the previous centres; however, this comparison may not remain valid through time. Discussions are underway in an attempt to establish boundaries which would be more precisely defined. [2] Seasonally adjusted data for Saskatchewan have been deleted because current data could not be satisfactorily adjusted.

---

[1] The number of stocks included has varied over the period; the totals shown in the column headings represent the current coverage. [2] The headings for "base metals" and "industrial mines" are not found in the Standard Industrial Classification. [3] Combines the industrials, utilities and finance common stocks. [4] Stocks included in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. [5] Includes also the machinery industries (except electrical machinery) and the transportation equipment industries. [6] Stocks included in the mining index are for producing mines.

---

[1] This statement includes only receipts relating to budgetary revenue. Excluded are non-budgetary revenues such as Old Age Security Fund taxes, Prairie Farm Assistance Act levies, employer and employee contributions to government-held funds (Unemployment Insurance, Superannuation etc.), interest on government-held funds, and taxes collected on behalf of and transferred to other governments. [2] Beginning in December 1973, this category includes oil export tax. [3] March includes supplementary payments arising from the closing of the accounts. **Sources: The Canada Gazette and Dept. of Finance.**

Figures are rounded and may not add to totals shown

[1] For comparative purposes figures may differ from those previously reported to reflect changes in accounting during 1973-74. **Source: The Canada Gazette and Dept. of Finance**

(continued from page 8)

This very large quarter-to-quarter swing can be attributed to moderate liquidation of wholesale and manufacturing stocks, and to a small accumulation of retail inventories from the large volume of stocks built up in the first quarter. The movement in retail inventories was largely the result of some liquidation of the stocks of automobiles which, presumably as a result of unexpectedly weak sales, had been accumulated last quarter.

The External Sector

Current dollar exports of goods and services grew 3.7 per cent in the second quarter, largely as a result of increased sales to the United States. The increase in exports was strongest in iron ore, automobiles, and newsprint. Imports increased relatively slowly, growing 1.5 per cent after a 6.2 per cent increase last quarter, and as a result of these movements, the balance of trade in goods and services improved by about $800 million at annual rates. All of this improvement came in the merchandise balance, which swung to a surplus from a deficit last quarter, while the service balance continued to deteriorate.

Incomes

The slower growth in nominal expenditure this quarter was reflected in income terms by a substantial deceleration in indirect taxes less subsidies, somewhat lower growth in capital consumption allowances, and a decline in accrued net income of farm operators from farm production. Other factor income payments increased at a higher rate than last quarter. Net national income grew 3.8 per cent in the second quarter, compared with 4.1 per cent in the first three months of the year.

Wages, salaries and supplementary labour income grew 4.7 per cent in the second quarter, but almost half of the growth in the labour income was the result of retroactive wage payments in the public sector. Corporation profits before taxes were virtually unchanged after falling 3.9 per cent in the first quarter; within broad industrial groups, there appear to have been increases only in mining and manufacturing, and the gain in manufacturing was marginal.

Despite the generally higher rates of growth in factor earnings in the second quarter, personal income grew only 2.7 per cent compared with last quarter's 4.6 per cent increase. This deceleration was caused by lower net income received by farm operators and a drop in interest, dividends and miscellaneous investment income paid to persons. The large decline in net personal income tax collections from the anomalously high first quarter level resulted in growth in personal disposable income increasing to 5.5 per cent from 2.7 per cent.

The Government Sector

Total revenues of all levels of government combined (excluding inter-government transfers) declined 2.0 per cent in the second quarter, after an increase of 6.9 per cent in the first quarter. This largely reflected irregular movements in personal income tax collections which have been affected by the large refunds made in the second quarter. Revenue from indirect taxes rose 4.4 per cent mainly due to higher returns from federal and provincial sales taxes, and partly offset the decline in personal direct taxes. There was little change in the other revenue components.

Total expenditures of all levels of government combined rose 3.0 per cent in the quarter, following a 4.0 per cent increase in the first quarter. The largest absolute increase took place in outlays on current goods and services and was associated with very large retroactive wage payments, particularly at the local and hospital levels. Transfer payments to persons fell slightly with declines in unemployment insurance benefits and in grants to post-secondary educational institutions and benevolent associations. Interest payments on the public debt fell sharply; the decline was entirely at the federal level.

As a result of a decline in revenues and continued increases in expenditures, the deficit, on a National Accounts basis, of the government sector as a whole widened from $2,388 million in the first quarter to $5,864 million in the second quarter.

Prices

The implicit price index for gross national expenditure rose 3.3 percent in the second quarter after a 2.1 per cent increase in the first, but much of this was due to an increase in the implicit price index of government current expenditure which rose 8.3 per cent as a result of the large retroactive wage payments. Excluding government current expenditure the overall increase was 2.0 per cent compared with 1.9 per cent in the first quarter. The implicit price index for gross fixed capital formation increased 2.3 per cent and there were very moderate increases in external trade prices. The implicit deflator for total personal expenditure increased 1.6 per cent, which was roughly the same rate as last quarter. There were large quarter-to-quarter movements in the rates of change of the deflators for individual expenditure components, however, as the increase in the implicit price index for durable expenditure fell to 0.5 per cent from 2.4 per cent last quarter, and the rise in the implicit price index for semi-durables fell to 1.3 per cent from 1.9 per cent. The implicit price index for non-durables, on the other hand, accelerated to a 0.9 per cent increase from the extremely low 0.1 per cent change last quarter. The price of services also accelerated, to a 2.7 per cent rise from 1.7 per cent.

Capital consumption allowances and miscellaneous valuation adjustments	16,720	17,260	17,712	18,220	17,478	18,808	19,312
Residual error of estimate	-760	336	608	416	150	776	348
Gross National Product at market prices	153,340	157,408	164,776	169,004	161,132	177,048	182,864
Gross National Product at market prices excluding accrued net income of farm operators	149,620	153,448	160,516	165,800	157,346	173,240	179,456

[1] Excludes profits of government business enterprises.

[2] Includes the withholding tax applicable to this item.

[3] Includes profits (net of losses) of government business enterprises and other government investment income.

[4] Includes an arbitrary smoothing of crop production, and standard seasonal adjustment for withdrawals of grain from farm stocks and for the changes in farm-held livestock and other inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures of accrued net income of farm operators.

[5] Includes net income of independent professional practitioners.

[6] See footnote 4, Table 2.

Farm and grain in commercial channels[5]	928	432	-48	-724	147	392	-8
Exports of goods and services	39,032	39,596	40,440	41,064	40,033	43,024	44,596
Deduct: Imports of goods and services	-44,680	-45,156	-45,424	-46,356	-45,404	-49,228	-49,976
Residual error of estimate	764	-336	-604	-420	-149	-772	-344
Gross National Expenditure at market prices	153,340	157,408	164,776	169,004	161,132	177,048	182,864
Final domestic demand	156,176	163,004	172,028	176,632	166,960	181,040	188,560
Detail of farm inventories and grain in commercial channels:							
Value of crop production and depletions of farm stocks of grain	664	732	-560	-716	30	908	940
Change in other farm-held inventories	304	180	76	-248	78	-196	-276
Grain in commercial channels	-40	-480	436	240	39	-320	-672

[1] Includes defence expenditures. Details are shown in line 45, Table 16 of the forthcoming publication *National Income and Expenditure Accounts, Second Quarter* (Catalogue 13-001).

[2] Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which are defined as current expenditure.

[3] Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals. Capital expenditure is defined to include all transfer costs on the sales and purchases of the existing land and buildings.

[4] The book value of inventories is deflated to remove the effect of price changes and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between this value of physical change and the change in book value is called the inventory valuation adjustment. (See line 8, Table 1.)

[5] In the seasonally adjusted series, the value of grain crop production in each quarter is taken as one fourth of the estimated value of crop production for the year as a whole (see footnote 4, Table 1). All other items in the farm inventories series are seasonally adjusted by standard techniques.

Table 3. Gross National Expenditure in Constant (1971) Dollars, by Quarters, 1975 and 1976
Seasonally adjusted at annual rates[1]

Gross National Expenditure in 1971 dollars[1]	109,532	110,272	111,968	112,128	110,975	115,116	115,116
Final domestic demand	113,920	116,084	119,148	119,852	117,251	120,616	121,992

[1] The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

(continued from page 10)

The universe of the study was defined as all operating public general and allied special hospitals in Canada. Public mental hospitals and tuberculosis sanatoria were included in some cases to give a complete picture of the public hospital sector in Canada. In 1973, the public hospital sector accounted for 94 per cent of the rated bed capacity in Canada, compared to 69 per cent in the case of public general and allied special hospitals. No reference is made to proprietary and federal hospitals since these institutions do not have to submit annual financial reports.

The first part of the study looks at the hospital sector with respect to some general economic indicators. Within this framework, the hospital sector is compared in terms of its size relative to the health sector as a whole, and then its contribution to the Canadian economy is determined in terms of the labour force and the GNP.

The second part of the study attempts to describe and quantify the "inputs" used by the hospital sector in its normal activities. The data is classified under the following three main headings: physical resources (institutions); human resources; and, operating expense. The third part studies hospitals' utilization of the inputs presented in the second part.

Senior Staff Changes at Statistics Canada

Appointments

Mr. B. J. Lynch has been appointed Director of Prices Division, General Statistics Branch, Business Statistics Field. For the past three years Mr. Lynch has been Director, Program Evaluation Division, Policy, Planning and Evaluation Branch.

He is a graduate of the University of Ottawa (St. Patrick's College) and came to Statistics Canada in 1957 where he began work in what is presently the Industry Product Division. He has served in a variety of positions with progressively increasing responsibility, and brings to his new duties a wide range of experience and knowledge of Statistics Canada's programs of business statistics and economic accounts.

Dr. A. Romaniuc has been appointed Director of Census Characteristics Division, Content and Analysis Branch, Census Field. He was formerly the Director of the Population Estimates and Projections Division, a position which he has held since January 1974.

Before joining Statistics Canada in 1968, he held various academic positions, including Research Associate at the Office of Population Research, Princeton University, and professor of demography at the University of Ottawa and the University of Montreal.

Mr. J. B. Salley has been appointed Director of External Trade Division, General Statistics Branch, Business Statistics Field. Since 1973 he has been an Assistant Director in the External Trade Division and has played a major role in the management of the United States/Canada Trade Reconciliation program which has now gained international recognition. Mr. Salley joined Statistics Canada from the Department of Finance in early 1972.

Departure

Mr. W. M. Illing, Director of Prices Division, has been appointed General Director, Forecasting Division, Universities Branch in the Ministry of State for Science and Technology.

Canadian Statistical Review

Data in this publication were retrieved from CANSIM® (Registered Trade Mark of Statistics Canada for its Canadian Socio-Economic Information Management System), and processed to create a photo-ready copy from which this publication was produced. CANSIM is the Statistics Canada computerized data bank; series published in this Review (as well as other data) are available on computer printouts, cards, tape or directly via terminal.

The identification numbers at the top of each column of data refer to the unadjusted and seasonally adjusted monthly or quarterly data in this column. Series maintained by Statistics Canada carry a "D" prefix (e.g. D 1375). The "B" prefix (e.g. B 1437) identifies series in CANSIM which are maintained by the Bank of Canada.

More details on which data is available can be found in the following:

CANSIM Summary Reference Index (Annual with periodic amendments) – Free on request.

This index is a summary of the data in CANSIM. It provides a key to the Series Directory and is the first step in locating and ordering series from the CANSIM Main Base.

CANSIM Main Base Series Directory (Annual with periodic amendments) – $30.

This Directory is a detailed guide to the data on the CANSIM Main Base. It gives the title, start date, source of the data, and other descriptive material. The Directory is published in three volumes.

CANSIM Mini Base Series Directory (Annual with periodic amendments) – $10.

This Directory is a detailed guide to the data on the CANSIM Mini Base – a standard subset of data originating from the CANSIM Main Base which is available at various Secondary Distributors.

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used in Statistics Canada is the U.S. Bureau of the Census Method II, X-11 variant. Seasonal adjustment removes the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing.

While seasonal adjustment allows a much better look at the underlying trend of a series, the adjusted series will contain irregular fluctuations. Small changes between months in the adjusted series may simply be erratic movements and, to obtain a clearer idea of the underlying trend, users should examine the adjusted series over a number of months. The MCD, or Months for Cyclical Dominance, in a table containing seasonally adjusted series, indicates the smallest span of months for which the average percent change without regard to sign in the trend cycle is greater than that in the irregular factor. For the smoothest series in MCD is 1, for the most erratic series it is 6. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.

Editorial Board

This publication is produced under the guidance of the Canadian Statistical Review Editorial Board, composed of the following Statistics Canada staff members:

G. Leclerc (Chairman) – Assistant Chief Statistician, Economic Accounts and Integration Field

V. Berlinguette – Assistant Chief Statistician, Business Statistics Field

R.E. Drover – Director, User Advisory Services Division

F. Emmerson – Co-ordinator, Financial Statistics

B.J. Lynch – Director, Prices Division

R. Platek – Director, Household Surveys Development Division

J.R. Podoluk – Director General, Household Statistics Branch

J. Randall – Director, Financial Flows and Multinational Enterprises Division

L.O. Stone – Senior Advisor, Population Studies and Statistics, Census

P.N. Triandafillou – Director, Current Economic Analysis Division

J.S. Wells – Director General, System of National Accounts (Current) Branch

M. Wisenthal – Director General, Institutional and Public Finance Statistics Branch

G. Bériault-Prud'homme – Editor, Canadian Statistical Review

Inquiries about the contents of the Canadian Statistical Review should be directed to the editor at : Current Economic Analysis Division, 23rd. Floor, Section M, R.H. Coats Bldg., Tunney's Pasture, Ottawa, Ontario, K1A 0T6.

Subscriptions

The *Canadian Statistical Review* and other catalogued publications of Statistics Canada, including a free annotated catalogue of current publications, may be ordered from Publications Distribution, Statistics Canada, Ottawa, K1A 0T6 and remittances made payable to the Receiver General for Canada.

A weekly supplement containing data published between release dates of this review is distributed free of charge to all subscribers.

Historical data for selected economic indicators, both adjusted and unadjusted for seasonal variation, are distributed to subscribers in an Annual Supplemment.

Correspondence should be directed to the *Canadian Statistical Review,* Current Economic Analysis Division, Statistics Canada, R.H. Coats Tower, Ottawa, Ontario, K1A 0T6.

Supply of Physicians: The Proximity Approach

D.E. Angus and D.A. Brothers*

Previous studies have identified distance as a factor affecting medical care utilization in both and rural locations.[1] Findings from these studies indicate that, other things being equal, patients tend to minimize travel to a physician. Using the province of Alberta as an example, a methodology which allows the relationship between doctors and people to be examined in terms of distance, is developed and discussed in this paper. This methodology is referred to as the proximity approach. It is anticipated that planners and policy makers in the health care sector could use this type of methodology in reaching decisions regarding the supply and distribution of physicians, especially when this methodology is supported by studies of productivity, manpower substitution and spatial determinants of seeking care.

This method of considering supply and distribution of physicians, although not unique[2] nor the ultimate approach in providing all the information required by the decision makers in the health services sector, does provide useful information about the spatial distribution of population in relation to physicians. The approach followed in the proximity method is to establish a correlation, in terms of distance, between people and the physician closest to them, irrespective of artificial boundaries, e.g., regions within a province. Since this method permits calculation of fine levels of disaggregation, one of the major benefits of this approach is the resulting information it provides regarding the distance that people would likely have to travel in order to obtain the services of a physician.

The proximity approach is dependent upon some assumptions. The first is that all physicians (by specialty) provide relatively similar quality and levels of medical care. It follows from this assumption that consumer-patient flow is based upon the proximity to medical care, i.e., people will go to the closest doctor.
The area chosen for examination in this paper is the province of Alberta. The reasons for selecting this province are, first, as a result of an earlier study of physician manpower in Alberta,[3] the required data are available, and, second, the authors are familiar with the area. For the sake of simplicity and brevity, only general practitioners and general surgeons are considered.

There are two sources for the data used in this paper. The first is the Alberta Medical Manpower Data File, which contains information published annually by the Alberta College of Physicians and Surgeons, such as certified specialties obtained and location, i.e., city, town or village, for all physicians registered to practice in Alberta during the period 1963-1972. On the Alberta Medical Manpower Data File, the lowest level of disaggregation is city, town or village, e.g., Edmonton, Lethbridge, Cochrane, Breton. The other source of data is the 1971 census of population of Canada, which distributes the population according to census enumeration area. A census enumeration area, comprised of about 500 people, represents the smallest unit of disaggregation on the 1971 census summary tape data files.

Methodology

Essential to the calculation of distance variables is the availability of some measure of relative location. This was accomplished by adding a special Universal Transverse Mercator Coordinate System (UTM) to a 1971 Census of Population Summary tape file. Normal UTM Zones cover only 6 degrees of latitude; therefore a stretched UTM system was used to cover all of Canada with a single zone thereby eliminating the need for interpolation across UTM Zone boundaries. Each set of coordinates represented approximately the mean areal centre (centre of gravity) of the enumeration areas population.

The centre of gravity for each municipality was then obtained by calculating the weighted mean areal center of the enumeration areas contained within the municipality. It was at this location that physician services within a municipality were assumed to be available. Then for each enumeration area in the province, the distance to all municipalities providing a particular type of service was calculated as follows:

$$D_{ij} = \left[(X_i - X_j)^2 + (Y_i - Y_j)^2\right]^{1/2}$$

where D = distance,
X = UTM northing coordinates,
Y = UTM easting coordinates,
i = 1 to m enumeration areas,
j = 1 to n municipalities.

It follows that the nearest available service is represented by D_{ij}^{min}.

This distance along with the number of doctors providing the service, the census division and municipality code numbers are appended to the enumeration area record. It is then possible to aggregate and display the distance and mobility information at any of the levels available within the census geographic coding hierarchy. For example: tables 1 to 4 display information at the census division level, however the same type of information could be displayed at the finer municipality level or perhaps a more aggregated level such as census metropolitan area or census urban/rural designated areas.

Results and Discussion

As was outlined in the methodology, the proximity method allows the distribution of population in Alberta by the location of the closest doctor and the calculation of distance of people to the nearest physician, without the constraints of artificial barriers, i.e., in this situation, census division boundaries. After the distribution and distance functions are calculated at the lowest levels of disaggregation, the results are combined and shown at the census division level. In Alberta, there existed fifteen such census divisions in 1971. These census divisions are statistical units only, and, as such, do not necessarily represent economic or health service areas in Alberta.

Tables 1 and 3 show the percentage distribution of population in Alberta by location of closest general practitioner and general surgeon, respectively, for 1971. For the most part, people in census divisions 1 to 15 were in a position to obtain the services of general practitioners and general surgeons in their respective census divisions, as evidenced by the data presented along the diagonal in each table. For example, in census division 6 and 11, in which are located the cities of Calgary and Edmonton, respectively, virtually all of the population were closest to general practitioners in their own areas, while in other census divisions, e.g., 5, 9 and 14, this situation was not the norm for a significant proportion of the people in these regions (Table 1). Consideration of these percentage distributions horizontally indicates that some people were actually closer to general practitioners and general surgeons in census divisions other than the one in which they resided. For instance, one-third of the people in census division 5 were closer to general surgeons in other census division, i.e., 2, 3, 6 and 8 (Table 3). Examination of the census map of Alberta shows census divisions 5 being bordered primarily by cencus divisions 2, 3, 6 and 8. The population which was closest to general surgeons in these regions was probably located around the borders of these five census divisions.

The major benefit of the proximity method is the information provided on the distance that people would likely have to travel in order to obtain the services of a physician. Tables 2 and 4 show the distances the population in Alberta would have had to travel to visit general practitioners and general surgeons, respectively, in 1971. For example, 72.8 per cent of the population in census division 1 were within 4 kilometers of a general practitioner in 1971, and in census division 9 almost one-fifth of the people were between 50 and 99 kilometers away from a general practitioner (Table 2). From Table 4, it becomes obvious that proportionately more people would have to travel greater distances to obtain the services of specialists, in this case general surgeons. For example, it is likely that 35.8 per cent of the population in census division 4 would have had to travel between 100 and 199 kilometers to visit a general surgeon in 1971.

It would be interesting and worthwhile for future research to broaden and strengthen the scope of this initial exercise by taking into consideration such things as the volume of patients treated by physicians, the availability of medical treatment facilities and paramedical personnel, and other locations in Canada. Using patient records for patient place of residence a further direction would be to test hypotheses regarding the relationship of distance to the use of health resources and, perhaps, develop a model for deriving health service areas. Finally, if adequate data regarding physician productivity could be obtained, the explicit assumptions upon which the proximity method is based could be relaxed.

(continued on page 143)

Observations

National Health Survey

How healthy or ill are Canadians? The Canada Health Survey will be providing answers. Sponsored by Statistics Canada and by Health and Welfare Canada, the survey is designed to find out the health status of Canadians. It will provide a comprehensive picture of the physical and emotional health of Canadians, and their exposure to lifestyle, bio-medical and environmental risks.

The survey derives from the working paper *A New Perspective on the Health of Canadians* published by Health and Welfare Canada in 1974 and from the associated need to supplement existing information which focusses on morbidity and mortality. The valuable information produced will be used by federal and provincial authorities in planning future health services and preventive measures.

The Canada Health Survey consists of a questionnaire dealing with illness and the use of medical services as well as a number of physical measurements. Statistics Canada will be responsible for the questionnaire while Health and Welfare Canada will be responsible for the voluntary program of physical measurements. The survey is significantly different from most other national health surveys. An important feature will be the balanced approach to topics: clinical data and respondent perception will be gathered on both positive and negative parameters of health and risk exposure. Other health surveys, for example, tend to concentrate on sickness information without collecting clinical and self-report data from the same respondents, or the same depth of information on exposure to lifestyle-associated risks.

Planned as an integrated household survey with an annual sample of 40,000 Canadians covering all provinces, the Canada Health Survey will be inaugurated on a nation-wide basis early 1978.

Pre-testing of 260 households was conducted in July and August 1976. Additional tests of the interview, questionnaire and physical measures component are planned for this fall and a major field trial integrating all these aspects into a single operation will take place in the summer of 1977.

Readers interested in obtaining further information about this survey can write to: Canada Health Survey, Statistics Canada, 1305 Richmond Road, Ottawa, Ontario K1A 0T6.

Retail Commodity Survey

An extensive survey of all chain and department stores in Canada and a random sampling of the other retail outlets was conducted in 1974 by the Merchandising and Services Division.

The 1974 retail commodity survey is an update of the first such survey conducted in 1968; it features the addition of more than 100 commodity items as well as improved methodology. From the 94 kinds of business in the retail trade universe, three were excluded: liquor, wine and beer stores. The remaining 91 kinds of business were included in the sample frame and grouped into 56 kinds of business.

The results of the survey are presented in an 80-page tabular report giving detailed information on commodity sales according to kind of business. The report contains three tables: Table 1 gives total sales by major store groups and kind of business for Canada and the provinces, and shows the grouping of the 94 kind-of-business classification in 56; table 2 covers kinds of business by commodity for Canada and the provinces; and table 3 details commodity distribution nationally and provincially.

Retail Commodity Survey, 1974 (Catalogue 63-526) is available for $2.80 from Publications Distribution, Statistics Canada, Ottawa, Ontario, K1A 0T6.

Inquiries about this publication should be addressed to R.H. Carter, Merchandising and Services Division, Statistics Canada, Ottawa, Ontario, K1A 0T6 (613-996-9301).

University Graduates

An educational profile of university graduates in

Canada has been prepared by the Education, Science and Culture Division. The study is based on the Highly Qualified Manpower Survey conducted in 1973 by Statistics Canada on behalf of the Ministry of State for Science and Technology and other interested departments.

The Highly Qualified Manpower Survey was a sample survey based on the 1971 Census. In 1971, one third of all households in Canada received the Census "long" form which included questions on the education of members of the household. The HQM population file was created by extracting from the 1971 Census file the records of those persons who claimed to have a university degree.

The Educational Profile of University Graduates does not provide any information on other characteristics of degree holders such as employment; it deals only with their education. The report describes the education, as of 1973, of persons who had a degree on June 1, 1971.

The following are the principal facts that emerge from the study:

1. In September 1973, there were 630.6 thousand persons living in Canada who had been included in the 1971 Census and who had a university degree on June 1, 1971.
2. The individual fields of study with the largest numbers of graduates were secondary education (41.3 thousand), general arts (35.2 thousand) and commerce and business administration (35.0 thousand). The groups of study fields with the most graduates were the social sciences (23%), education (18%) and the humanities (15%).
3. About 55% of the undergraduate and first professional degrees were taken in the social sciences, education and the humanities, however, only 41% of the doctorates were in these fields. The "natural sciences" (agricultural and biological, health, architecture and engineering, physical and mathematical) were the fields of study for only 36% of the undergraduate and first professional degrees but for 58% of all doctorates.
4. Only 31% of all degree holders were women. This proportion decreases with the level of qualification: women had 41% of general undergraduate degrees but only 9% of the doctorates.
5. The individual fields of study with the highest proportion of female graduates were: nursing (99%), household sciences and dietetics (99%), library and archival science (78%), social work (65%), English (64%), fine arts and music (62%), French (61%), other languages (59%), anthropology (59%), rehabilitation therapy and related health sciences (58%), classics (56%), general arts (51%) and sociology (51%).

   Forestry was the field of study most dominated by men (99%), followed by the engineering fields (99%), geological sciences (95%), agriculture (95%), veterinary sciences (95%), dentistry (94%), law (94%), physics (93%), theology and religion (93%), commerce and business administration (92%) and architecture (92%).
6. In 1971, 7% of all men over 21 had degrees and 3% of all women. The proportion of university graduates in the population has been increasing: 2.4% of the population born before 1920 had degrees but almost 7% of those born after 1944 (this latter proportion should increase as some Canadians in this age group have acquired, or will receive, degrees after 1971. In addition, immigration of university graduates will tend to increase the proportion.) The percentage of women over 21 with degrees has increased from 1.4% for those born before 1920 to 5.4% of those born afer 1944.
7. Almost one quarter of all degree holders resident in Canada on June 1, 1971 were born elsewhere. Probably because of employment prospects (since most immigrants have completed their education abroad), they tend to have studied in certain fields. They were only a small component of graduates in fields such as general arts (10%) and education (16%). However, immigrants accounted for high proportions of the graduates in the following fields of study: languages other than English or French (54%), botany (47%), physics (40%), biochemistry and related medical specialities (39%), architecture (39%), chemistry (38%), geological sciences (37%), anthropology (35%), medicine and surgical specialties (34%) and fine arts and music (34%).
8. The proportion of foreign born graduates who were female was lower than the Canadian average (31%) for all except three countries of birth. About 64% of all immigrant degree holders born in the Philippines were women, 47% of those from the U.S.A. and 31% of those from Germany.
9. University graduates born outside Canada tended to have higher level qualifications than those born in Canada: 21% of graduates with under-graduate or first professional degrees as

---

[1] The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. [2] Includes logging, fishing, trapping and hunting. [3] Includes mechanical and construction. [4] Includes a small number in non-specified occupations. [5] Does not include students entering Canada on students' visas. [6] Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force.

---

[1] Excludes profits (net of losses) of government business enterprises. [2] Includes the withholding tax applicable to this item. [3] Includes profits (net of losses) of government business enterprises and interest and miscellaneous investment income of government. [4] Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. [5] Includes net income of independent professional practitioners. [6] See footnote 4, Table 1.2.

---

[1] Includes defence expenditures. [2] Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. [3] Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals and business investors. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. [4] The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment, (as shown in Table 1.1). [5] See footnote 4, Table 1.1.

[1] The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

---

[1] Includes the taxes on life insurance companies introduced in 1969. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals in so far as their investment activities are concerned. The 1969 taxes are thus included here pending a complete review of the treatment of insurance. [2] Excludes the special refundable tax on corporations introduced in May 1966 Refunding of the tax began in 1968. [3] Withholding taxes. [4] The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four. Since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series.

For source see Table 1.9.

---

[1] These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change.

For source see Table 1.9.

[1] The labour force as a percentage of the population 15 years of age and over The participation rate for a particular group (age, sex etc.) is the labour force in that group expressed as a percentage of the population for that group. [2] The unemployed as a percentage of the labour force. The unemployment rate for a particular group (age, sex etc.) is the unemployed in that group expressed as a percentage of the labour force for that group. Seasonally-adjusted rates are calculated by dividing seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and seasonally-adjusted unemployment (i.e. seasonally-adjusted labour force by summation).

Note: Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error In general, the smaller the estimate, the larger is the relative sampling error For other explanatory material see notes at the end of Catalogue No. 71-001.

[1] Persons who have applied for or are in receipt of unemployment insurance benefit at the end of the month. [2] Annual figures are averages of 12 months. [3] Includes adjustments for cancellation of warrants and collection of overpayments. [4] Trainees under the Adult Occupation Training Act receiving U.I. benefit, prior to July 1975 included with regular benefit.

[1] A vacancy rate is obtained by expressing the number of vacancies per thousand existing jobs (sum of vacant and filled jobs) in all industries, except agriculture, fishing and trapping, domestic service and the non-civilian component of public administration and defence. Both full-time and part-time jobs are included. [2] Includes Prince Edward Island and the Yukon and Northwest Territories for which separate reliable estimates are not available. [3] Due to postal strike the mail sample was reduced. These estimates should be used with caution due to their reduced reliability.

---

[1] In calculating time lost, only the workers directly affected by the strike or lockout are taken into account. time lost by workers indirectly affected, such as those laid off as a result of a work stoppage, is not included. [2] The industry groups prior to January 1973 are based on the 1960 Standard Industrial Classification. From January 1973 forward, the 1970 S.I.C. is used. [3] The number of man-days is calculated by multiplying the number of workers involved in a work-stoppage by the number of normal working days during the stoppage. Adjustments are made for establishments on shift work, etc. [4] The statistics for individual industries exclude strikes and lockouts involving fewer than 100 workers; however, the total includes all work stoppages. The agriculture, finance, insurance and real estate and public administration and defence industries are not shown separately. Should strikes occur in these industries, the time lost also will be shown in the total. In addition, the total is revised quarterly whereas the individual categories are revised annually. [5] Includes miscellaneous manufacturing industries. [6] Includes publishing and allied industries. [7] Includes storage and communication industries.

[1] The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. [2] Excludes agriculture, fishing and trapping, education and related services, health and welfare services, religious organizations, private households, public administration and defence. [3] Includes storage, electric power, gas and water utilities [4] Excludes domestic service.

[1] See footnote 1 and source in Table 10. [2] Employment indexes in total manufacturing and in its total durable and non-durable components are given in Table 9. [3] In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. [4] Except machinery and transportation equipment industries.

[1] The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. [2] In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing.

---

[1] These rounded weights, provided as a general guide, show the relative importance of the major components of the C.P.I., on average, during the year 1974. [2] Includes shelter and household operation. Until April 1973, the shelter element of regional cities' housing indexes moved on the basis of changes in rents only. However, from May 1973 on home-ownership has been included in the shelter element of regional cities' housing indexes, so that the Canada and regional cities' shelter indexes now contain the same elements.

Section 6 · Manufacturing

78 1. Total Inventories, Shipments, Orders
79 2. Manufacturing Shipments, Selected Industries
81 3. Manufacturing Inventories, Selected Industries
83 4. Manufacturing Shipments and Unfilled Orders by Economic Use Classification
84 5. Manufacturing Inventories Owned and Raw Materials by Economic Use Classification
85 6. Manufacturing Goods in Process and Finished Products by Economic Use Classification
86 7. Tobacco and Beverages
86 8. Rubber
87 9. Rubber Products
87 10. Raw Hides, Skins, Finished Leather
88 11. Footwear Production
88 12. Primary Textiles
89 13. Production of Sawn Lumber
89 14. Pulpwood, Wood Pulp and Newsprint
90 15. Primary Iron and Steel
91 16. New Motor Vehicles
92 17. Refrigerators, Freezers, Washing Machines and Clothes Dryers
92 18. Radio and Television Sets

Table 1: Total inventories, shipments and orders in manufacturing based on the 1970 standard industrial classification (million dollars)

				Inventory at end of month						
						All inventory held				
Annual average and month	Shipments[1]	New orders received during month[2]	Unfilled orders at end of month	Owned[3]	Held but not owned	Total	Raw materials	Goods in process	Finished products	Ratio of inventories owned to shipments

---

[1] Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been substituted [2] Total new orders received during the period at estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. [3] Total manufacturing inventory owned by manufacturers including warehouse stocks

---

[1] Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been estimated

---

[1] 100 cu. ft. of solid wood; pulpwood produced for domestic use and excluding exports, but including receipts of purchased roundwood. [2] Total pulp production covers "screenings" which are already included in exports. "Screenings" are excluded throughout from mechanical and chemical pulp. [3] Customs exports. [4] Mill shipments destined for export.

[1] Data compiled according to the Steel Distribution Index revised January, 1964 Figures on net shipments relate to semi finished and rolled steels products only. Shipments to consuming industries of castings, forgings and steel pipe are not included [2] Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities. [3] Includes appliances and utensils. [4] Excluding shipments for re-processing at maker's own plant.

---

[1] Production plus imports less re-exports, minus exports. [2] Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and distributors) was based on "actual cost to purchaser" rather than the suggested list price as in the past.

Sources: Motor Vehicle Shipments (42-002), New Motor Vehicle Sales (63-007), Trade of Canada, Imports (65-007), Exports (65-004), Statistics Canada.

[1] Gas types are included. [2] Includes producers' shipments for export. [3] In some cases these shipments are not at the factory level, and stocks at beginning of month plus production less shipments do not equal stocks at end of month. [4] End of period. [5] Electric and other. [6] Excludes apartment type machines. [7] Excludes other than electric. **Sources: Domestic Refrigerators and Freezers (43-001), Domestic Washing Machines and Clothes Dryers (43-002), Trade of Canada, Exports (65-004), Imports (65-007), Statistics Canada.**

---

[1] These totals include all generating agencies producing over twenty million kilowatt hours per year. [2] These columns include all generating utilities and generating industries respectively, producing over twenty million kilowatt hours per year. [3] Less imports. [4] Total net generation less net exports.

Note: Components may not add to totals due to rounding. Current figures in this table are preliminary and therefore subject to revision. [1] Supply and disposition for both Crude Oil and Natural Gas will not agree because of losses, inventory changes, pipeline fuel used etc. [2] Includes crude oil, condensate and pentanes plus. [3] Gross new production by field less field flared and waste.

---

[1] Barrels of 35 Canadian gallons [2] Includes domestic and imported crude oil, condensate and pentanes plus received by Canadian refineries [3] Refinery production (from crude oil, condensate and pentanes plus, and commingled propane butane mixes) plus other materials used [4] Includes deliveries of butane commingled in the crude stream in Saskatchewan and Alberta. [5] Includes inventories at end of period being held at gas plants and in storage caverns [6] Includes stove oil, kerosene [7] Includes aviation gasoline and aviation turbo fuel [8] Due to conceptual changes, the stock and sales series are not available on a comparable basis prior to June 1965. Includes propane and propane mixes and butane and butane mixes [9] Includes petro-chemical feed stocks, naphtha specialties, coke, lubricating oil and grease, still gas and other products

---

[1] A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly.

Source: Housing Starts and Completions (64-002), Statistics Canada.

Note: Components may not add to totals due to rounding differences. [1] Data are on a gross basis i.e. they do not take account of cancellations or alterations of loans after initial approval. [2] Agency loans (loans made by other lending institutions on behalf of C.M.H.C.) are included under C.M.H.C. [3] Includes fraternal and mutual benefit societies, Quebec savings banks and, since May 1967, chartered banks. [4] Includes new and existing commercial structures and farm property.

---

[1] In this context, "softwood" refers to wood from coniferous trees, and hardwood to wood from broadleafed species [2] Includes export shipments, the softwood lumber column includes estimates for Manitoba, Newfoundland and P.E.I. [3] Shipments by principal manufacturers. Total domestic shipments are somewhat higher [4] Production for these items. As reported by principal manufacturers. Total production is somewhat higher [5] Building contractors, public and utility construction and structural steel fabricators.

Note: Components may not add to totals due to rounding [1] The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when the current annual totals for all firms are known the following year [2] The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users Even though sales are to users, i e farmers, values are stated at wholesale prices, i.e. cost to dealers.

[1] Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of output Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. [2] 1973 and 1974 price indexes are subject to revision [3] 1974 price indexes are subject to revision. [4] Farm share only of motor vehicles. [5] In addition to the components listed, the major group includes Building Repairs, Fencing Construction and Repairs, Mortgage Credit, and Farm Rent. [6] In addition to components listed, the major group includes Seed, Custom Work, Artificial Insemination, Small Tools and Supplies, and Electricity.

[1] Since January 1975 total milk production has been obtained by adding sales off farms to first receivers (usually marketing boards) and volume used on farms for feeding and farm house consumed. [2] Includes case and bulk. [3] As at end of period. Last month is preliminary. [4] Exclusive of Newfoundland, includes hatching eggs.

[1] Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada. Data shown for the last current year are not so adjusted. [2] Production is calculated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. [3] Includes baking and frying oils and fats. [4] Includes stocks held by manufacturers and other warehouses. [5] Includes fresh sausage, frankfurters, weiners and all other sausage. [6] Includes solid, coated, bulk, packages and novelties. [7] The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of 1970, be collected on the basis of factory sales.

Note Components may not add to totals because of rounding

[1] Credit extended mainly to individuals and chiefly for personal consumption expenditures Data exclude consumer indebtedness arising from residential mortgages, home-improvement loans and bank loans fully secured against marketable securities Figures do not include statistics on interpersonal loans, bills owing to doctors, dentists, lawyers, and other personal service credit. [2] Conditional sales agreements held by sales finance companies and by consumer loan companies in connection with the financing of retail purchases of consumers' goods and repaid in instalments. Amounts shown exclude unearned finance charges. [3] Personal cash loans of up to $1,500 made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges [4] Personal cash loans over $1,500, usually repaid in instalments. Amounts shown exclude unearned finance charges. [5] Includes bank-sponsored credit card balances [6] The data for Quebec savings bank loans are not seasonally adjusted as no seasonality is present this series is repeated in the unadjusted form [7] Amount owed by personal (non-commercial) credit card holders to oil companies, airlines, auto-rental firms, and international travel and entertainment credit card issuing companies. [8] Bills due for non-commercial use of telephones, gas and electric power [9] Personal cash loans only The data for mortgage and trust companies are not seasonally adjusted because there are not yet enough data to determine a pattern of seasonality this series is repeated in the unadjusted form.

---

[1] Column numbers refer to tables 3 and 4 section 11. [2] Includes special transaction-trade, not shown separately [3] The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. [4] Revisions made to ensure consistent coverage. The most important are: Farm machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc.

---

[1] Column numbers refer to tables 3 and 4, section 11. [2] The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. [3] Includes special transaction-trade, not shown separately. [4] Includes scrap. [5] Some series such as General purpose machinery have been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) now include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery **Source: Trade of Canada Imports (65-007), Statistics Canada.**

[1] Beginning with 1970, figures include the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Transair) normally account for approximately 85 per cent of the total revenues and expenses reported by Canadian commercial air carriers. [2] Cargo includes air freight and express but excludes mail and excess baggage.

[1] Bank of Canada deposits are averages of the juridical days in the month shown while Bank of Canada notes and Canadian dollar deposit liabilities are averages of the 4 consecutive Wednesdays ending with the second last Wednesday in the previous month. [2] Daily averages for period [3] Mainly deposits of foreign banks. [4] Capital, rest fund and undivided profits as at the latest fiscal year-end. [5] Including issues payable in foreign currency [6] Excluding Canadian day-to-day loans. [7] Securities purchased direct from issuer with a term of less than one year at time of issue are classified as loans. [8] Loans to grain dealers and exporters. [9] Loans to finance purchase of Canada Savings Bonds at time of issue. [10] Including loans to instalment finance companies [11] These series reflect the combination of two CANSIM series.

Note: Components may not add to totals because rounding. [1] This series was designed to cover 50 clearing house centres. With the advent of centralized data processing, bank clearing houses have been eliminated. The current allocation of cheques cashed continues to reflect what had been the previous centres; however, this comparison may not remain valid through time. Discussions are underway in an attempt to establish boundaries which would be more precisely defined. [2] Seasonally adjusted data for Saskatchewan have been deleted because current data could not be satisfactorily adjusted.

Note: Components may not add to totals due to partial revisions.

[1] End of period. [2] Excluding Treasury Bills, Canada Savings Bonds and other non-market issues. [3] Figures are subject to revision. Series cover all publicly announced issues and some private placements not publicly announced. Notes with an original term to maturity of over one year. [4] Includes Canadian Pension Plan series bonds issued by the provinces and their agencies and purchased by the C.P.P. Investment Fund. [5] Consists of issues of Canadian religious and other institutions and Canadian dollar issues of foreign debtors. [6] Allowance for the take-over of Nova Scotia Light & Power common shares.

[1] The number of stocks included has varied over the period, the totals shown in the column headings represent the current coverage. [2] The headings for "base metals" and "industrial mines" are not found in the Standard Industrial Classification. [3] Combines the industrials, utilities and finance common stocks. [4] Stocks included in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. [5] Includes also the machinery industries (except electrical machinery) and the transportation equipment industries. [6] Stocks included in the mining index are for producing mines.

(continued from page 10)

highest qualifications were immigrants; 28% of those with masters degrees and graduate diplomas and 51% of those with doctorates.

10. Slightly more than one third of all foreign born degree holders had immigrated between 1966 and June 1, 1971. This was the most significant period of immigration for graduates from the Philippines (80%), India (67%), Czechoslovakia (55%) and the U.S.A. (43%). The main period of immigration of Hungarian born graduates was 1956-1965 (58%). On the other hand, most of the degree holders born in the U.S.S.R., Germany, Poland and the Netherlands arrived before 1955 (usually after the Second World War).

11. In general, foreign born degree holders had already acquired some or all of their university qualifications before their arrival in Canada. Only 36% acquired all their qualifications in Canada, whereas 92% of the Canadian born had only Canadian degrees and diplomas. Even fewer of the immigrants (30%) completed secondary schooling in Canada.

12. In 1973, one-fifth of all university graduates who had completed secondary schooling in Canada lived in a different province from that of their secondary schooling. Six provinces were net "exporters" (i.e., fewer graduates with Canadian secondary schooling moved into the province than left it). Of these six (Newfoundland, Prince Edward Island, Nova Scotia, New Brunswick, Manitoba and Saskatchewan), Saskatchewan and Prince Edward Island had particularly large outflows. In 1973, 56% of the degree holders who had completed secondary schooling in Saskatchewan, and 54% of those in Prince Edward Island, lived in other provinces. Only Newfoundland was able to become a net "importer" because of immigration from other countries. Ontario gained substantially: four times as many graduates came to Ontario after completing their secondary schooling elsewhere as left for other provinces. This inflow did not affect the other provinces equally. For example, 21% of those graduates who finished school in Nova Scotia, 19% of those in New Brunswick, 18% of those in Prince Edward Island and 18% of those in Manitoba, were residents of Ontario in 1973. The lowest provincial proportions came from Quebec and British Columbia (9% each). Thirty-one percent of degree holders who completed secondary schooling in Saskatchewan were living in Alberta or British Columbia in 1973.

13. The provinces benefited unequally from immigration. In British Columbia, 21% of the university graduates living there completed secondary schooling abroad. Ontario and Alberta had the next highest proportions, 19% and 18% respectively (although 46% of all those with foreign secondary schooling were residents of Ontario in 1973). Only Prince Edward Island had a proportion of graduates with foreign secondary schooling of less than 10%.

14. More graduates obtained their last highest earned degree in the U.S.A. than in any province except Ontario or Quebec. More doctorates were granted in the U.S.A. and the U.K. than in all Canadian universities. These two countries were especially prominent as suppliers of doctorates in fields such as economics (68% of all doctorates in economics), English (58%), education (56%) and geological sciences (52%).

15. Foreign countries were important sources of doctorates even for Canadian born university graduates. Almost half of the doctorates obtained by Canadian born degree holders came from other countries, mainly the U.S.A. (32% of all doctorates for Canadian born graduates).

16. There were substantial movements of graduates between provinces after the awarding of their last degrees in Canada. In 1973, 21% lived in a province other than that in which they obtained their last degree. Ontario, Quebec, Newfoundland and British Columbia "kept" the highest proportions of the graduates who obtained their last degrees in these provinces: only 14%, 15% 18% and 19% respectively were living elsewhere at the time of the survey. The other provinces had large outflows: those of New Brunswick (54%), Saskatchewan (48%), Nova Scotia (47%) and Manitoba (39%) were particularly heavy. For none of these last four provinces did the entry of persons who had acquired their last highest earned degree elsewhere, in Canada or abroad, equal the numbers living outside these provinces after obtaining their highest degree.

17. The mother tongue of the Canadian born university graduates may have influenced the

choice of field of study. Agricultural and biological sciences, and mathematical and physical sciences were relatively more popular with English-speaking graduates than with French-speaking graduates. Conversely, relatively more degree holders with French as mother tongue studied in the education fields, the health sciences and general arts. However, the relative popularity of the health sciences and general arts and sciences declined for both language groups (from 13% and 12% for those born before 1930 to 8% and 5% for those born after 1929). Another shift in preferences is apparent in the humanities. While the percentage of English-speaking Canadian born graduates who took humanities as their last major field of study remained constant at 15%, the percentage of French-speaking graduates declined from 19% of those born before 1930 to 12% of those born after 1929.

The Educational Profile of University Graduates (Catalogue 81-566) can be obtained from Publications Distribution, Statistics Canada, Ottawa, Ontario, K1A 0T6. Price: 70 cents.

Canadian Statistical Review

Data in this publication were retrieved from CANSIM® (Registered Trade Mark of Statistics Canada for its Canadian Socio-Economic Information Management System), and processed to create a photo-ready copy from which this publication was produced. CANSIM is the Statistics Canada computerized data bank; series published in this Review (as well as other data) are available on computer printouts, cards, tape or directly via terminal.

The identification numbers at the top of each column of data refer to the unadjusted and seasonally adjusted monthly or quarterly data in this column. Series maintained by Statistics Canada carry a "D" prefix (e.g. D 1375). The "B" prefix (e.g. B 1437) identifies series in CANSIM which are maintained by the Bank of Canada.

More details on which data is available can be found in the following:

CANSIM Summary Reference Index (Annual with periodic amendments) – Free on request.

This index is a summary of the data in CANSIM. It provides a key to the Series Directory and is the first step in locating and ordering series from the CANSIM Main Base.

CANSIM Main Base Series Directory (Annual with periodic amendments) – $30.

This Directory is a detailed guide to the data on the CANSIM Main Base. It gives the title, start date, source of the data, and other descriptive material. The Directory is published in three volumes.

CANSIM Mini Base Series Directory (Annual with periodic amendments) – $10.

This Directory is a detailed guide to the data on the CANSIM Mini Base – a standard subset of data originating from the CANSIM Main Base which is available at various Secondary Distributors.

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used in Statistics Canada is the U.S. Bureau of the Census Method II, X-11 variant. Seasonal adjustment removes the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing.

While seasonal adjustment allows a much better look at the underlying trend of a series, the adjusted series will contain irregular fluctuations. Small changes between months in the adjusted series may simply be erratic movements and, to obtain a clearer idea of the underlying trend, users should examine the adjusted series over a number of months. The MCD, or Months for Cyclical Dominance, in a table containing seasonally adjusted series, indicates the smallest span of months for which the average percent change without regard to sign in the trend cycle is greater than that in the irregular factor. For the smoothest series in MCD it is 1, for the most erratic series it is 6. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.

Editorial Board

This publication is produced under the guidance of the Canadian Statistical Review Editorial Board, composed of the following Statistics Canada staff members:

G. Leclerc (Chairman) – Assistant Chief Statistician, Economic Accounts and Integration Field
V. Berlinguette – Assistant Chief Statistician, Business Statistics Field
R.E. Drover – Director, User Advisory Services Division
F. Emmerson – Co-ordinator, Financial Statistics
B.J. Lynch – Director, Prices Division
R. Platek – Director, Household Surveys Development Division
J.R. Podoluk – Director General, Household Statistics Branch
J. Randall – Director, Financial Flows and Multinational Enterprises Division
L.O. Stone – Senior Advisor, Population Studies and Statistics, Census
P.N. Triandafillou – Director, Current Economic Analysis Division
J.S. Wells – Director General, System of National Accounts (Current) Branch
M. Wisenthal – Director General, Institutional and Public Finance Statistics Branch
G. Bériault-Prud'homme – Editor, Canadian Statistical Review

Inquiries about the contents of the Canadian Statistical Review should be directed to the editor at : Current Economic Analysis Division, 23rd. Floor, Section O, R.H. Coats Bldg., Tunney's Pasture, Ottawa, Ontario, K1A 0T6.

Subscriptions

The *Canadian Statistical Review* and other catalogued publications of Statistics Canada, including a free annotated catalogue of current publications, may be ordered from Publications Distribution, Statistics Canada, Ottawa, K1A 0T6 and remittances made payable to the Receiver General for Canada.

A weekly supplement containing data published between release dates of this review is distributed free of charge to all subscribers.

Historical data for selected economic indicators, both adjusted and unadjusted for seasonal variation, are distributed to subscribers in an Annual Supplemment.

Correspondence should be directed to the *Canadian Statistical Review,* Current Economic Analysis Division, Statistics Canada, R.H. Coats Tower, Ottawa, Ontario, K1A 0T6.

Note to Users

This section is used to announce changes in tables of the *Canadian Statistical Review* and in related CANSIM series.

Section 6, Table 17 – Refrigerators, freezers, washing machines and clothes dryers.

The series titled "Mechanical Refrigerators, Domestic Type Sales" and "Freezers, Domestic Type Home and Farm Sales" have been replaced respectively by "Total Domestic Sales of Mechanical Refrigerators" (D 339995) and by "Total Domestic Sales of Home and Farm Freezers" (D 339996).

Factors Influencing the Choice of Mode of Travel to Work, in 1973, 1974 and 1975

F.S. Jones and J.S. Lewis*

> Ten or twenty thousand of the heads of families of the working classes could and would escape from the wretched habitations in which they now live and die if they could avail themselves of out of town residence by being conveyed morning and evening by cheap trains.
> C. Pearson, 1855.

Views on the importance of urban transportation have been expressed for over a hundred years, but it is only in recent years that governments have decided to collect, tabulate and interpret transportation data. With the onset of the "energy crisis" and increasing fuel costs, commuting problems and the role of subsidized public transportation have taken on a new dimension. The purpose of the Travel to Work survey of Statistics Canada is to obtain information on fundamental patterns of the trip to work and the travel behaviour of the employed labour force. The survey seeks information on the distance to work in miles, the availability of public transportation, the mode of transportation normally used, the time of travel by the usual mode, the time of travel by public transportation, and the mode of travel to work used when the usual mode is unavailable. These characteristics are of unusual interest as they are available on a nationwide basis for the first time in Canada and over a period spanning the energy crisis.[1]

The full travel survey has been taken three times: in November 1973, November 1974 and October 1975. Shortened travel surveys were taken in June 1974 and June 1975 – these did not request information on travel times and no data from them are referred to in this paper. All surveys were actually supplements to the regular Labour Force Survey. This means that the travel data may be cross-classified and used with other characteristics of the labour force such as age, sex, occupation and hours worked per week. The sample size, about 35,000 individuals travelling to work, constrains the extent of cross-classification possible; for example the use of the data is limited for area breakdowns.[2] This is necessary with all data derived from the Labour Force Survey sampling frame but is a particular disadvantage with data applied to regional and urban research and planning, such as the travel to work data. Even with these constraints, however, many useful applications are possible. An objective of this study is to exemplify one of the many potential uses of this data.

The main focus of this study is the analysis of the commuter's choice of mode of travel to work. Specifically, we have attempted to estimate the influences of a variety of factors affecting the choice between the automobile and public transportation. The term "commuter" refers to any employed person who must leave his or her home to get to the workplace, no matter what the distance or mode of travel chosen. This definition is consistent with that in the Buchanan report on traffic in Britain.[3]

Choice of Mode of Travel

The choice of mode of travel to work has long been an important aspect of urban life. In the pre-automobile era the major problem was lack of mobility, requiring workers to live in crowded dwellings near the workplace. The solution appeared to lie in providing cheap public transportation, which would lessen the pressure on housing in central locations by encouraging workers with higher earnings to live in the more spacious suburbs.[4] By contrast, the contemporary urban transportation problem is often considered to be the result of too much mobility, encouraged by the widespread and increasing use of the automobile and limited-access traffic arteries.[5] When compared to public transportation, and when considered in per passenger mile terms, automobile travel contributes more to pollution and congestion, is more wasteful of energy, capital and land and involves greater risk to pedestrians and commuters.[6] As in the pre-automobile period, improved public transportation subsidized by governments is often advocated as a primary means of reducing congestion and improving the urban environment.

---

*F.S. Jones is an Economist on the staff of the Regional and Urban Research and Development Division; J.S. Lewis is a Statistician on the staff of the Structural Analysis Division.

[1] The first travel to work survey was conceived by Mr. R. Ryan of Special Surveys Coordination Division, Statistics Canada, in September 1973. The only previous travel information asked of individuals was the place of work, asked in the 1971 census. The workplace was coded to the census tract level permitting airline distances between the residence and workplace census tract centroids to be calculated.

[2] Area breakdown must be limited to preserve reliability of data and confidentiality of respondents.

[3] *Traffic in Towns, The Specially Shortened Edition of the Buchanan Report*, Penguin Books, Harmondsworth England, 1964.

The most notable aspect of current modes of travel is the predominance of the automobile. About 50 per cent of all commuter trips in Canada are by persons driving cars without passengers, and the percentage continues to rise each year (Table 1). The percentage is lowest in Québec at about 45 per cent and highest in British Columbia where it exceeded 60 per cent in 1975. About 9 per cent of commuters drive to work with passengers and about 13 per cent travel as passengers in private cars. Thus, nearly three fourths of all commuters are conveyed by the automobile. Passengers using public transportation (bus, streetcar or subway) are only a little more numerous than passengers in private automobiles – about 15 out of a hundred commuters compared to 13.

The only other significant mode of travel to work is walking; it accounted for just over 8 per cent of all trips nationally. Regionally, walking is most popular in the Atlantic provinces (10 to 11 per cent of commuters) and least popular in British Columbia (under 8 per cent). Walking increased in 1974 but then declined in 1975 to below the 1973 level. This seems to directly reflect the temporary public concern with energy conservation.

In studying the declining use of public transportation, an important factor to consider is its availability. The first three columns of Table A indicate that public transportation to work is available only to about half of the commuters in Canada.[7] Availability is particularly limited in the Atlantic region where only about one in four commuters stated public transportation was available. Public transportation to work is most generally available in the highly urbanized provinces of Ontario and Québec. The second three columns of Table A indicate that even among commuters who state public transportation to work is available, the actual use of public transportation varies significantly among regions, from a high of over 30 per cent in Québec to a low under 20 per cent in the Atlantic provinces.[8]

Many factors, some of which cannot be measured, determine the individual commuter's choice between public transportation and the automobile. For convenience they may be grouped under two headings: policy related (those factors which may be influenced by policy decisions), and policy unrelated. In the first group would fall factors related to the quality of the public transportation service. Demographic attributes as well as characteristics of the residence and workplace locations may be considered unrelated to policy. These two groups may be further sub-divided into factors represented and unrepresented in the data base.

The best indicator of quality of public transportation in the data base is the portal-to-portal time required to travel to work by public transportation. More detailed aspects of quality, unavailable in the data base, may also influence modal choice. Since the time spent walking to the bus stop, waiting for the bus and transferring may be viewed with more (or less) displeasure than time spent riding on a bus,

---

[4] Two early discussions on urban transportation are: Edwin Chadwick, "On the Sanitary Advantages of Smooth and Impermeable Street Surfaces", *Journal of the Society of Arts*, September 29, 1871, pp. 789-792; and by the same author in the November 17, 1876 issue of the same journal "On Improved Urban Transit, Required as a Means of Urban Sanitation". Mr. C. Pearson argued in 1855 that subsidized trains running from new suburbs to central locations of London would benefit the working classes. In developing his case he presented a table showing the population by mode of travel to work: Great Britain, *Special Committee on Metropolitan Communication, 1854-1855* (Appendix), Parliamentary Papers, Vol. X, 1854-1855 session.

[5] See, for example, J.R. Meyer, J.F. Kain and M. Wohl, *The Urban Transportation Problem*, Harvard University Press, Cambridge, 1965; and Werner Z. Hirsch, *Urban Economic Analysis*, McGraw Hill, New York, 1973.

[6] This is certainly true during peak commuting hours, but could not be generalized to other times when, for example, transit companies must operate nearly empty buses to maintain some continuity of service. An early study, still relevant, on the effects of the growth of automobile travel on congestion, waste of energy and capital, the demand for greater street capacity and on accidents and fatalities, is the article by Miller McClintock titled "Traffic Regulation" in the *Encyclopaedia of the Social Sciences*, Vol. 15, MacMillan: New York, 1935.
Hirsch, op. cit., provides a modern overview of the relationship between commuting mode and urban problems and summarizes the argument for subsidization of public transportation.

[7] In a 1972 U.S. travel survey 51.7 per cent of the commuters indicated public transportation to work was available: U.S. Department of Transportation, *Nationwide Personal Transportation Study – Home to Work Trips and Travel*, Report No. 8, August, 1973, p. 36.

[8] The U.S. survey asked why public transportation was not used, and the survey report mentions three reasons: (1) it took too long (2) it was not convenient to the place of work, and (3) it involved too many transfers. Some commuters used public transportation because they had no car available or no driver's license. Commuters in larger urban areas preferred public transportation because it was cheaper than the automobile and presented no parking problems. Ibid., p. 37. About 20 per cent of U.S. commuters who had public transportation to work available, used this mode of travel.

TABLE A. Availability and Degree of Use of Public Transportation, Canada and Regions. November 1973, November 1974 and October 1975.

	Percentage of commuters reporting availability of public transportation			Percentage of commuters with public transportation available who use it to go to work		
	1973	1974	1975	1973	1974	1975
Canada	53.7	53.7	50.8	29.9	28.4	28.9
Atlantic	26.5	27.2	23.1	19.5	18.7	18.9
Québec	58.6	54.8	51.6	34.2	32.0	31.7

British Columbia	44.7	47.2	48.6	25.1	25.6	24.7

data on these component times may constitute important additional knowledge to gather in future surveys.[9] The *variation* in waiting time may also influence the choice of mode. Whether or not a whole or part of the journey is express and on a bus lane is another potentially significant factor since non-stop bus journeys would tend to be closer to automobile travel times. Such information is more specific to transit policy options than is total travel time. Other amenity factors which might in future be probed would include temperature control and availability of a seat.[10]

Demographic characteristics are potentially important factors in the choice of mode since various subpopulations may place different importance on aspects of public transportation quality and may differ in access to and need for automobile transportation. A wide range of characteristics are represented in the data base: age, sex, marital status, occupation, and hours worked. Notable omissions include labour force status of spouse,automobile ownership and income. Among locational factors only the region, size of urban area of residence and distance to work are represented in the data base. The urban area size also reflects public transportation quality and effects of traffic congestion. Other potentially relevant information, unrepresented in the data base, include the spatial distribution of workplaces (whether downtown or suburban), the cost and availability of parking at the workplace, and the cost of public transportation.

The Modal Choice Model

From the nearly thirty five thousand commuters in the Labour Force Survey a subsample was extracted consisting of the employed persons to whom public transportation (bus, subway or streetcar) was available. The model includes only the choice between public transportation and the automobile. Train and taxi commuters were omitted because of their very small number (less than 0.5 per cent of all commuters) and special characteristics. There is obviously some shifting among modes of travel between summer and winter months, but the survey months are expected to represent a nearly average distribution for the year. Approximately twelve thousand of the survey respondents comprise this subsample, which is almost entirely urban. The sampling weights have been used in the modelling procedure without adjustment. The subpopulation represented is about 3.7 million persons.

The model assumes the choice between public transportation and the automobile to be a function of the following factors:

Urban size
Region of residence
Time by public transportation
Distance to work
Age
Sex
Marital status
Hours worked per week
Occupation

---

[9] D.A. Quarmby, in "Choice of Travel Mode for the Journey to Work", *Journal of Transport Economics and Policy*, Vol. 1, September 1967, found that the economic value of walking time was two to three times the value of riding time in Leeds, England. This might be higher in Canada, especially in winter, and would vary regionally.

[10] A review of factors is given in Martin Weeks, "Consumer Attitudes Toward Transit Service: An Interpretive Review", *American Institute of Planners Journal*, January 1976.

Observations

The CANSIM Cross-Classified System

CANSIM (Canadian Socio-Economic Information Management System) is a fully computerized "data bank" containing current and historical information for the most widely used statistics of Canada. CANSIM's role continues to be "the official Statistics Canada vehicle for the primary transmittal of machine-readable macro data to the public". Until now, the data base has been limited to handling economic, "time-series" information.

Having achieved its primary goals within the economic environment of Statistics Canada, CANSIM is now applying the knowledge of the last decade to the development of a companion base of social information. Because the most significant portion of social data is in the form of "cross-classified" characteristics of individuals and institutions, this new base will be referred to as the Cross-Classified Module.

Purpose

The objectives of such a base can be summarized briefly: "the development of a detailed and conceptually compatible set of socio-demographic, socio-economic data maintained by a system through which data can be easily entered, stored, maintained and manipulated in a uniform general format".

From an analytical point of view, the module provides general purpose access to existing statistical measures which describe the social processes and characteristics of the population of Canada.

Structure

Because the data base is subject to wide variations in content and interpretation and to considerable diversity in its formats and aggregations, for simplicity of utilization, it is organized according to a standard structure – the TABLE. In order to assist the user in both determining and accessing available statistical data within TABLES, detailed retrieval documentation will be available.

The Systems Approach

This new software has been designed to maximize the flexibility of the system while minimizing the prerequisite for extensive programming knowledge. The following are some of the more important highlights of the system:

- the design makes efficient use of on-line disk space while providing, through standard access methods, simultaneous batch and interactive retrieval using terminals supported by a "prompt" mode;
- a complete security package (provided by selective scrambling) is available; it has the facility to freeze data during verification and limit access prior to and after the release of a TABLE;
- a directory file provides extensive table and data descriptive capabilities in both official languages;
- to reduce costs of repeated sub-setting and restructuring of tables, users are provided with an option of a single, private user file for storage and manipulation using APL (A Programming Language);
- a complete set of bilingual manuals, guides and directories will be available.

Demands for more advanced data handling capabilities will be monitored so that after a trial implementation period, the concentration will be directed to system and data organization efficiencies.

Perspectus

Presently, health, education, science, cultural and judicial tables are being entered, the first of which will be available in January 1977.

For further information on the module, its availability and more detailed documentation, contact CANSIM, Statistics Canada, R.H. Coats Building, Ottawa, K1A 0Z8 (613-995-0575).

New Surveys

A quarterly newsletter, *New Surveys,* presents brief abstracts of plans for surveys reported to Statistics Canada in compliance with the Treasury Board Circular issued in September 1974, entitled: Guidelines for Requests for Information from More Than Ten Respondents. Commonly referred to as "The Rule of Ten", this directive requires all federal departments and agencies to consult Statistics Canada before launching any survey seeking information from more than ten respondents or making major revisions to existing surveys.

New Surveys (Catalogue 11-006) is published by the Special Surveys Co-ordination Division and is available from Publications Distribution, Statistics Canada, Ottawa K1A 0T6.

Copies of the brochure entitled *The Rule of Ten* can be obtained by contacting the "Rule of Ten" Staff, Special Surveys Co-ordination Division, Statistics Canada, Room 908, Jeanne Mance Bldg, Ottawa K1A 0T6, (613-996-3769).

Both publications are free.

Consulting Engineering Services

Consulting Engineering Services, 1974 presents the results of a survey of consulting engineering services available in Canada in 1974. The survey was initiated by the Department of Industry, Trade and Commerce in close co-operation with the Association of Consulting Engineers of Canada. Statistics Canada developed and implemented the programme in conjunction with these two groups. It is the first in-depth survey of the consulting engineering industry to be carried out by Statistics Canada although consulting engineers did form part of the service sector of the 1971 Census of Merchandising and Services.

The report is divided into three sections. Section I provides a general description of the survey objectives, definition, questionnaire content, coverage, response rate and problems encountered with data collection and evaluation. Section II summarizes classification and economic data not included in Section III, such as ownership, subsidiaries, foreign projects and a provincial breakdown of branches. Section III presents in tabular form the results of the survey.

Consulting Engineering Services, 1974 (Catalogue 63-528) is available from Publications Distribution, Statistics Canada, Ottawa K1A 0T6. Price: 70 cents.

Inquiries about the contents of this publication may be directed to Mrs. R. Bennett, Merchandising and Services Division, Statistics Canada, Ottawa K1A 0T6, (613-996-9311).

Statistical Data on the Performing Arts – 1975*

It cost $5.85 per spectator to present a play in 1975, and theatre organizations received grants totalling $2.31 per spectator and collected an average of $3.30 per spectator themselves; hence their average deficit was $0.24 per spectator. The average expenses of music organizations per spectator totalled $6.80, while their average revenue came to $6.69, including $3.56 in government and private grants. Dance organizations showed an average deficit of $0.19 per spectator despite revenue totalling $8.76 per spectator. The average grants of opera organizations totalled $6.99 per spectator, and the average revenue was $15.39; however, their expenses were $17.66 per spectator.

These figures are taken from a survey conducted annually by the Education, Science and Culture Division. In 1975, 43 theatre organizations, 14 music organizations, 6 dance organizations and 5 opera organizations participated in the survey.

The average grants, revenue and expenses per organization in 1975 are presented in Table A.

Thus, on the average, grants accounted for over 40 per cent of the revenue of theatre organizations; the figure was 53 per cent in the case of music organizations, 56 per cent in the case of dance organizations and 45 per cent in the case of opera organizations. Table A also shows that without the financial support of governments and private firms, a theatre organization would have a deficit of $224,000, a music organization over $500,000, a dance organization close to $666,000 and an opera organization close to $573,000.

Federal government grants accounted for an average of approximately 20 per cent of the total revenue of theatre, music and opera organizations; provincial government grants 13 per cent of the total; municipal government grants 3 per cent to 5 per cent of the total; and private grants 7 per cent to 14 per cent of the total. The figures for dance organizations were 31 per cent, 10 per cent, 3 per cent and 12 per cent respectively. Table B shows the revenue, expenses and the source of grants of the organizations per spectator.

Turning now to the number of performances presented by organizations, we find that theatre organizations gave an average of 267 performances and drew over 325 people per performance; music organizations came next with an average of 136 performances, while dance and opera organizations pre-

---

[1] The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. [2] Includes logging, fishing, trapping and hunting. [3] Includes mechanical and construction. [4] Includes a small number in non-specified occupations. [5] Does not include students entering Canada on students' visas. [6] Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force.

Section 3 · System of National Accounts

1. Income and Expenditure Accounts

28 1.1 National Income and Gross National Product
28 1.2 Gross National Expenditure, Current Dollars
29 1.3 Gross National Expenditure, Constant Dollars
29 1.4 Sources of Personal Income
30 1.5 Disposition of Personal Income
30 1.6 Sources and Disposition of Gross Savings
31 1.7 Government Revenue, Expenditure, and Surplus of Deficit, by Level of Government
35 1.8 Implicit Price Indexes
35 1.9 Relation between Gross National Product at Market Prices and Gross Domestic Product at Factor Cost

2. Domestic Product by Industry

36 2.1 Real Domestic Product by Industry of Origin, Quarterly
37 2.2 Real Domestic Product by Industry of Origin, Monthly

3. Balance of International Payments

42 3.1 Canadian Balance of International Payments, Current Account, All Countries
42 3.2 Canadian Balance of International Payments, Current Account, Country Distribution
43 3.3 Canadian Balance of International Payments, Capital Account, All Countries

1—Income and expenditure accounts

[1] Excludes profits (net of losses) of government business enterprises. [2] Includes the withholding tax applicable to this item. [3] Includes profits (net of losses) of government business enterprises and interest and miscellaneous investment income of government. [4] Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. [5] Includes net income of independent professional practitioners. [6] See footnote 4, Table 1.2.

[1] Includes defence expenditures. [2] Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. [3] Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals and business investors. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. [4] The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment, (as shown in Table 1.1). [5] See footnote 4, Table 1.1.

---

[1] The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

---

[1] This item differs from column 6, table 1.1 by excluding the adjustment which has been made to take account of the accrued earnings arising out of the operations of the Canadian Wheat Board and the Canadian Co-Operative Wheat Producers. [2] Includes all interest on the public debt paid by government to persons. [3] Charitable contributions and bad debts.

For source see Table 1.9.

---

[1] Includes the taxes on life insurance companies introduced in 1969. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals in so far as their investment activities are concerned. The 1969 taxes are thus included here pending a complete review of the treatment of insurance. [2] Excludes the special refundable tax on corporations introduced in May 1966. Refunding of the tax began in 1968. [3] Withholding taxes. [4] The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four. Since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonel between the fourth and first quarters in the seasonally adjusted taxes of series.

For source see Table 1.9.

---

[1] These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change.

For source see Table 1.9.

---

[1] The labour force as a percentage of the population 15 years of age and over. The participation rate for a particular group (age, sex etc.) is the labour force in that group expressed as a percentage of the population for that group. [2] The unemployed as a percentage of the labour force. The unemployment rate for a particular group (age, sex etc.) is the unemployed in that group expressed as a percentage of the labour force for that group. Seasonally-adjusted rates are calculated by dividing seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and seasonally-adjusted unemployment (i e seasonally-adjusted labour force by summation).

Note: Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error In general, the smaller the estimate, the larger is the relative sampling error For other explanatory material see notes at the end of Catalogue No. 71-001

---

[1] Persons who have applied for or are in receipt of unemployment insurance benefit at the end of the month. [2] Annual figures are averages of 12 months. [3] Includes adjustments for cancellation of warrants and collection of overpayments. [4] Trainees under the Adult Occupation Training Act receiving U.I. benefit, prior to July 1975 included with regular benefit.

[1] Vacancies for full-time, casual, part-time, seasonal and temporary jobs which were immediately available. [2] Includes Prince Edward Island and the Yukon and Northwest Territories for which separate reliable estimates are not available. [3] Due to postal strike the mail sample was reduced. These estimates should be used with caution due to their reduced reliability.

---

[1] A vacancy rate is obtained by expressing the number of vacancies per thousand existing jobs (sum of vacant and filled jobs) in all industries, except agriculture, fishing and trapping, domestic service and the non-civilian component of public administration and defence. Both full-time and part-time jobs are included. [2] Includes Prince Edward Island and the Yukon and Northwest Territories for which separate reliable estimates are not available. [3] Due to postal strike the mail sample was reduced. These estimates should be used with caution due to their reduced reliability.

[1] In calculating time lost, only the workers directly affected by the strike or lockout are taken into account: time lost by workers indirectly affected, such as those laid off as a result of a work stoppage, is not included. [2] The industry groups prior to January 1973 are based on the 1960 Standard Industrial Classification. From January 1973 forward, the 1970 S.I.C. is used. [3] The number of man-days is calculated by multiplying the number of workers involved in a work-stoppage by the number of normal working days during the stoppage. Adjustments are made for establishments on shift work, etc. [4] The statistics for individual industries exclude strikes and lockouts involving fewer than 100 workers; however, the total includes all work stoppages. The agriculture, finance, insurance and real estate and public administration and defence industries are not shown separately. Should strikes occur in these industries, the time lost also will be shown in the total. In addition, the total is revised quarterly whereas the individual categories are revised annually. [5] Includes miscellaneous manufacturing industries. [6] Includes publishing and allied industries. [7] Includes storage and communication industries.

[1] The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below The Industrial Composite is the sum of all industries except agriculture, fishing and trapping, education and related services, health and welfare services, religious organizations, private households and public administration and defence

---

[1] The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below [2] In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing

[1] The data for the current year are subject to revision. [2] Includes gold. [3] Consists of general wholesale index less animal products and vegetable products component groups. [4] Consists of iron products and non-ferrous metals products component groups less gold. [5] These two series comprise the general wholesale index. [6] Excludes gold.

---

[1] These rounded weights, provided as a general guide, show the relative importance of the major components of the C.P.I., on average, during the year 1974. [2] Includes shelter and household operation. Until April 1973, the shelter element of regional cities' housing indexes moved on the basis of changes in rents only. However, from May 1973 on home-ownership has been included in the shelter element of regional cities' housing indexes, so that the Canada and regional cities' shelter indexes now contain the same elements.

---

[1] Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been substituted. [2] Total new orders received during the period at estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. [3] Total manufacturing inventory owned by manufacturers including warehouse stocks

[1] Starting with January 1968, production is manufacturers' production; prior to that date production was indicated by the use of excise duty stamps. [2] Intended for cigarettes.
[3] Includes pipe, plug, chewing, twist, snuff etc. [4] Includes sales to wholesalers or retailers [5] Subject to Excise Tax. [6] Includes sales for ships' stores and for export.
[7] End of period.

[1] 100 cu. ft. of solid wood; pulpwood produced for domestic use and excluding exports, but including receipts of purchased roundwood. [2] Total pulp production covers "screenings" which are already included in exports. "Screenings" are excluded throughout from mechanical and chemical pulp. [3] Customs exports. [4] Mill shipments destined for export.

[1] Data compiled according to the Steel Distribution Index revised January, 1964. Figures on net shipments relate to semi finished and rolled steels products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. [2] Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities. [3] Includes appliances and utensils. [4] Excluding shipments for re-processing at maker's own plant.

---

[1] Production plus imports less re-exports, minus exports. [2] Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and distributors) was based on "actual cost to purchaser" rather than the suggested list price as in the past.

Sources: Motor Vehicle Shipments (42-002), New Motor Vehicle Sales (63-007), Trade of Canada, Imports (65-007), Exports (65-004), Statistics Canada.

[1] Gas types are included. [2] Includes producers' shipments for export. [3] In some cases these shipments are not at the factory level, and stocks at beginning of month plus production less shipments do not equal stocks at end of month. [4] End of period. [5] Electric and other. [6] Excludes apartment type machines. [7] Excludes other than electric. **Sources: Domestic Refrigerators and Freezers (43-001), Domestic Washing Machines and Clothes Dryers (43-002), Trade of Canada, Exports (65-004), Imports (65-007), Statistics Canada.**

Note: Components may not add to totals due to rounding Current figures in this table are preliminary and therefore subject to revision. [1] Supply and disposition for both Crude Oil and Natural Gas will not agree because of losses, inventory changes, pipeline fuel used etc. [2] Includes crude oil, condensate and pentanes plus. [3] Gross new production by field less field flared and waste.

---

[1] Barrels of 35 Canadian gallons. [2] Includes domestic and imported crude oil, condensate and pentanes plus received by Canadian refineries. [3] Refinery production (from crude oil, condensate and pentanes plus, and commingled propane/butane mixes) plus other materials used [4] Includes deliveries of butane commingled in the crude stream in Saskatchewan and Alberta. [5] Includes inventories at end of period being held at gas plants and in storage caverns [6] Includes stove oil, kerosene [7] Includes aviation gasoline and aviation turbo fuel. [8] Due to conceptual changes, the stock and sales series are not available on a comparable basis prior to June 1965 Includes propane and propane mixes and butane and butane mixes. [9] Includes petro-chemical feed stocks, naphtha specialties, coke, lubricating oil and grease, still gas and other products

---

[1] A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly.

Note: Components may not add to totals due to rounding differences. [1] Data are on a gross basis i.e. they do not take account of cancellations or alterations of loans after initial approval. [2] Agency loans (loans made by other lending institutions on behalf of C.M.H.C.) are included under C.M.H.C. [3] Includes fraternal and mutual benefit societies, Quebec savings banks and, since May 1967, chartered banks. [4] Includes new and existing commercial structures and farm property.

[1] In this context, "softwood" refers to wood from coniferous trees, and hardwood to wood from broadleafed species. [2] Includes export shipments; the softwood lumber column includes estimates for Manitoba, Newfoundland and P.E.I. [3] Shipments by principal manufacturers. Total domestic shipments are somewhat higher. [4] Production for these items. As reported by principal manufacturers. Total production is somewhat higher [5] Building contractors, public and utility construction and structural steel fabricators.

---

[1] Cash receipts from farming operations excluding supplementary payments. Excludes Newfoundland. [2] Represents participation payments made by the Canadian Wheat Board direct to producers on crops delivered in previous years. [3] Includes rye, flaxseed, rapeseed, soybeans and corn. [4] Includes clover and grass seed, hay, clover, greenhouse, mustard seed, sunflower seed, hops, dry beans and dry peas and miscellaneous products. [5] Made under the authority of the Agricultural Stabilization Act.

Note: Components may not add to totals due to rounding. [1] The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when the current annual totals for all firms are known the following year. [2] The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers.

---

[1] Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of output. Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. [2] 1973 and 1974 price indexes are subject to revision. [3] 1974 price indexes are subject to revision. [4] Farm share only of motor vehicles. [5] In addition to the components listed, the major group includes Building Repairs, Fencing Construction and Repairs, Mortgage Credit, and Farm Rent. [6] In addition to components listed, the major group includes Seed, Custom Work, Artificial Insemination, Small Tools and Supplies, and Electricity.

Sources: Prices and Price Indexes (62-002), Index Numbers of Farm Prices of Agricultural Products (62-003), Statistics Canada.

[1] Since January 1975 total milk production has been obtained by adding sales off farms to first receivers (usually marketing boards) and volume used on farms for feeding and farm house consumed. [2] Includes case and bulk. [3] As at end of period. Last month is preliminary. [4] Exclusive of Newfoundland; includes hatching eggs.

[1] Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada. Data shown for the last current year are not so adjusted. [2] Production is calculated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. [3] Includes baking and frying oils and fats. [4] Includes stocks held by manufacturers and other warehouses. [5] Includes fresh sausage, frankfurters, weiners and all other sausage. [6] Includes solid, coated, bulk, packages and novelties. [7] The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of 1970, be collected on the basis of factory sales.

Note. Components may not add to totals because of rounding.

[1] Credit extended mainly to individuals and chiefly for personal consumption expenditures. Data exclude consumer indebtedness arising from residential mortgages, home-improvement loans and bank loans fully secured against marketable securities. Figures do not include statistics on interpersonal loans, bills owing to doctors, dentists, lawyers, and other personal service credit. [2] Conditional sales agreements held by sales finance companies and by consumer loan companies in connection with the financing of retail purchases of consumers' goods and repaid in instalments. Amounts shown exclude unearned finance charges. [3] Personal cash loans of up to $1,500 made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. [4] Personal cash loans over $1,500, usually repaid in instalments. Amounts shown exclude unearned finance charges. [5] Includes bank-sponsored credit card balances. [6] The data for Quebec savings bank loans are not seasonally adjusted as no seasonality is present. this series is repeated in the unadjusted form. [7] Amount owed by personal (non-commercial) credit card holders to oil companies, airlines, auto-rental firms, and international travel and entertainment credit card issuing companies. [8] Bills due for non-commercial use of telephones, gas and electric power. [9] Personal cash loans only. The data for mortgage and trust companies are not seasonally adjusted because there are not yet enough data to determine a pattern of seasonality: this series is repeated in the unadjusted form.

[1] Column numbers refer to tables 3 and 4 section 11. [2] Includes special transaction-trade, not shown separately [3] The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. [4] Revisions made to ensure consistent coverage. The most important are: Farm machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc.

[1] Column numbers refer to tables 3 and 4, section 11. [2] The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. [3] Includes special transaction-trade, not shown separately. [4] Includes scrap. [5] Some series such as General purpose machinery have been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) now include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. **Source: Trade of Canada Imports (65-007), Statistics Canada.**

[1] Beginning with 1970, figures include the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Transair) normally account for approximately 85 per cent of the total revenues and expenses reported by Canadian commercial air carriers. [2] Cargo includes air freight and express but excludes mail and excess baggage.

[1] Bank of Canada deposits are averages of the juridical days in the month shown while Bank of Canada notes and Canadian dollar deposit liabilities are averages of the 4 consecutive Wednesdays ending with the second last Wednesday in the previous month. [2] Daily averages for period. [3] Mainly deposits of foreign banks. [4] Capital, rest fund and undivided profits as at the latest fiscal year-end. [5] Including issues payable in foreign currency. [6] Excluding Canadian day-to-day loans. [7] Securities purchased direct from issuer with a term of less than one year at time of issue are classified as loans. [8] Loans to grain dealers and exporters. [9] Loans to finance purchase of Canada Savings Bonds at time of issue. [10] Including loans to instalment finance companies. [11] These series reflect the combination of two CANSIM series.

Note: Components may not add to totals because rounding [1] This series was designed to cover 50 clearing house centres. With the advent of centralized data processing, bank clearing houses have been eliminated. The current allocation of cheques cashed continues to reflect what had been the previous centres; however, this comparison may not remain valid through time. Discussions are underway in an attempt to establish boundaries which would be more precisely defined. [2] Seasonally adjusted data for Saskatchewan have been deleted because current data could not be satisfactorily adjusted.

---

[1] Excluding revivals, increases, dividend additions, reinsurance acquired, credit insurance and pension bonds without insurance. Value totals are estimates projected from the sales reported by companies operating in Canada representing over 80% of new ordinary and of new group contracts. [2] Total new settled-for ordinary sales in Canada. [3] Total sales figure does not include sales for Northwest Territories. [4] Under new or amended contracts.

Note: Components may not add to totals due to partial revisions.

[1] End of period. [2] Excluding Treasury Bills, Canada Savings Bonds and other non-market issues. [3] Figures are subject to revision. Series cover all publicly announced issues and some private placements not publicly announced. Notes with an original term to maturity of over one year. [4] Includes Canadian Pension Plan series bonds issued by the provinces and their agencies and purchased by the C.P.P. Investment Fund. [5] Consists of issues of Canadian religious and other institutions and Canadian dollar issues of foreign debtors. [6] Allowance for the take-over of Nova Scotia Light & Power common shares.

---

[1] The number of stocks included has varied over the period, the totals shown in the column headings represent the current coverage. [2] The headings for "base metals" and "industrial mines" are not found in the Standard Industrial Classification. [3] Combines the industrials, utilities and finance common stocks. [4] Stocks included in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. [5] Includes also the machinery industries (except electrical machinery) and the transportation equipment industries. [6] Stocks included in the mining index are for producing mines.

(continued from page 8)

Table 2 shows the distribution of the subpopulation within each of the factors and the chosen mode. The factors, as groups of "dummy" or attribute variables, have been employed in a linear regression model. Time and distance are basically quantitative but the survey captures these variables in ranges or categories; these are also used in dummy variable form, which has the advantage of permitting these factors to approximate non-linear effects.

There are other desirable explanatory factors which should be included but are generally unavailable and the accuracy of the model must suffer accordingly. The most important of these would be measures of comparative convenience of public transportation vs. the automobile which are related to the specific geographic situations of commuters. These factors would be necessary to modelling individual urban areas.

The model concerns the individual commuter's choice indicated by his "normal mode of travel to work": the dependent variable equals 1 when public transportation was used, and 0 for the automobile commuter.[11] With this dichotomous dependent variable, the coefficients are interpretable as increments to the probability of choice of mode attributable to each characteristic or variable assuming the other factors to be held constant. Although the model is not useful for making probability statements about individual commuters (the explanatory power is low: $R^2 = 0.2$) the large number of observations available has provided good estimation of the coefficients. The regression coefficients are presented in Table 3. Some interpretative comment is in order. The three annual models have displayed a few discernable trends, but the general patterns in the coefficients are fairly stable in spite of the onset of the energy crisis and the abrupt rise in gasoline cost which occurred in this period.

The travel time coefficients indicate a non-linear effect with maximum in the range including the 6 to 20 minute trip. For trips under 6 minutes (only 1 per cent of commuters are so fortunate) there is a small increasing preference for public transportation ("bus", for brevity). On the other side of the maximum, longer travel times are associated with lower propensities to use the bus. Commuters faced with bus trips longer than 40 minutes show a net preference for the automobile. Those not knowing the bus trip time are nearly all dedicated automobile commuters which explains the large negative coefficient for this variable. The time coefficients in general indicate that the propensity to use public transportation could be increased by reducing the longer travel times. The effectiveness can be estimated by examining the differences between the coefficients of adjacent travel time ranges. For example, if the 31-40 minute trips could be reduced to the 21-30 minute range, bus usage would increase by about 7% (.01 to .08 in coefficient terms). This might be accomplished by more frequent service, express service, bus lanes, new routes, etc. However, even this modest increase would be very costly to implement, in most urban areas. Transit companies find they have few possibilities to improve service to commuters whose travel time is already low, and efforts to reduce portal-to-portal time for the longer trips remain very expensive.

The independent assessment of the effect of travel time on modal choice hinges on the inclusion in the model of the distance factor (commuters not knowing the distance to work were excluded from the subpopulation). The coefficients display a uniform pattern. The longer the distance travelled, the more likely commuters are to choose public transportation to get to work. This result contrasts with the message one gets from looking at a tabulation of distance by mode of travel at the Canada level: for example, the percentage of commuters travelling to work by public transportation first increases with distance then decreases. In October 1975 the percentages were as shown in Table B.

The increasing coefficients of distance can be partially attributed to economic considerations. The bus fares are relatively independent of distance in many cities, but automobile running costs increase with distance. There are non-money costs which seem to be more important. The time spent walking to and from bus stops, waiting times, and transfers are largely unrelated to the distance travelled and would be of decreasing significance with increasing distance. This fixed cost of inconvenience of public transportation is apparently more of a deterrent to its use than the parking problem is to automobile commuters. The utility of the commuter's time is probably another significant influence contributing to the observed distance effect. Many commuters would prefer to spend 30 minutes on the bus (out of say 40 minutes portal-to-portal) reading their newspapers instead of 20 minutes in their automobiles fighting traffic. As distance decreases, however, the time, cost and convenience comparisons all encourage commuting by automobile.

The region of the country does not seem to influence greatly the propensity to travel by bus. Commuters in

---

[11] Other models of modal choice have been developed by Charles A. Lave, "The Demand for Urban Mass Transportation", *Review of Economics and Statistics*, Vol. LII, no. 3, August 1970, and S.L. Warner, *Stochastic Choice of Mode in Urban Travel: A Study in Binary Choice*. Northwestern University Press, Evanston, Illinois, 1962. These models rely heavily on cost and time data while the present model relies more on social and demographic characteristics of individual commuters. Lave employed a probit model with a small data set. This type of analysis is more appropriate but impractical with the data set and model complexity used here.

TABLE B: Percentage of Commuters Travelling to Work by Public Transportation, Canada, October 1975

Distance Travelled	Percentage Using Public Transportation
Less than 1 mile	14.8
1 - 2 miles	29.3
3 - 5 miles	32.4
6 - 10 miles	33.7
11 - 20 miles	25.1
More than 20 miles	17.2

British Columbia show a continuing preference for automobile travel which is only slowly declining. The urban size category, in contrast, has a strong effect on the choice of mode. Commuters in the largest metropolitan areas have a marked preference for travel by public transportation, when compared with commuters in smaller metropolitan areas and even more so when compared with commuters in non-metropolitan areas. The inconvenience of driving through heavier traffic is more common in larger metropolitan areas, thus reducing the relative advantage of automobile travel over public transportation. In addition, the quality of public transportation (measured in terms other than travel time) is generally higher in the larger metropolitan areas, two of which have subway systems.

The coefficients indicate that commuters in the younger and older age groups are more likely to travel by public transportation than commuters in the 25 to 54 age bracket. This result is consistent with a higher incidence of automobile ownership and driving permits among commuters in the middle age groups. A similar argument may explain the higher propensity of women and unmarried commuters to travel to work by public transportation. One might expect that if female labour force participation continues to increase there would be some increase in the use of public transportation. However, this must be qualified by noting that the preference of women to travel by public transportation declined between 1973 and 1975, and may continue to decline in the future.

Commuters working over 40 hours per week show a net preference for automobile travel. This result was expected since the automobile is a faster mode of travel and time savings would be more highly valued by persons working longer hours. Also transit service is less frequent in off peak hours when those working long hours would be more likely to commute. Commuters in managerial, professional and sales occupations show a greater likelihood of travelling by automobile than those in other occupational groups. This result may reflect a greater need for an automobile in the job, and a greater likelihood of car ownership and of working irregular hours.

Conclusion

The automobile is the predominant mode of transportation for commuters and the Travel to Work Survey confirms that its use continues to increase relative to other modes. Public transportation ranks a distant second. Of the half of the commuting population to whom public transportation is available, only three in ten are regular users. This study has attempted to assess some of the general factors contributing to the limited attraction of public transportation.

The data of the Survey provide information relating to the quality of public transportation and a number of demographic characteristics of the commuting population. A model of choice, specifically between public transportation and the automobile, has been employed to estimate the independent effects of these factors; the results of greatest interest are those of time and distance. The propensity to use public transportation increases uniformly with distance while the distribution of actual use (Table B above) displays a peak for the middle distances. This means that when the distance is of medium or long range, factors other than distance bias the choice toward the automobile. The transit time factor may deter use of public transportation in cases where the time is greater than ten minutes. Since the time factor can be influenced by urban policy with respect to public transportation, we have suggested a quantitative interpretation available from the model to indicate what could be expected from reductions in transit times. The possible increases in usage of public transportation appear to be quite small relative to the efforts implied. We conclude that social and demographic characteristics of commuters also bias the choice toward the automobile when the distance to work is medium or long range. These characteristics are beyond the influence of policy and may help to explain the difficulty in encouraging use of public transportation.

Given the convenience, speed, and increasing availability of the automobile, its use for commuting apparently will continue to increase until the economics of ownership and operation become a much more significant deterrent or until strong measures such as limiting central city parking or gas rationing might be implemented.

* "Commuter" is defined here as an employed person whose workplace is geographically separated from his or her residence. There were in Canada an estimated 7,653,000 commuters in November 1973, 7,871,000 in November 1974 and 8,002,000 in October 1975. Commuters represented 86.7 per cent, 85.7 per cent, and 85.1 per cent of the employed labour force in these three years.

** "Other modes" comprise the taxi, motorcycle, bicycle, commuter train, and unspecified modes. None of these categories accounted for over one and a half per cent of the commuters in any of the years.

(1) The numbers in brackets are the F statistics for the factors (groups of variables) and all are highly significant. The coefficients are adjusted to a weighted mean of zero within each group i.e. $\Sigma b^*_i P_i = 0$ where P_i is the proportion of the population having attribute i, b^*_i is the adjusted coefficient, and the summation is over members of a given factor. Thus, the adjusted coefficient is the *net* effect attributable to the variable.

[1] Including grants

A work was defined as having Canadian content if it was composed in whole or part by a Canadian. Using this definition it was found that 64 per cent of the plays presented in 1975 had Canadian content, and that 56 per cent of the total number of spectators at plays attended those with Canadian content. Twenty-five per cent of the music performances had Canadian content, and 24 per cent of the total number of spectators at music performances attended those with Canadian content. Eighty per cent of the dance performances had Canadian content, and 70 per cent of the total number of spectators at dance performances attended those with Canadian content; for operas those percentages were 30 per cent and 16 per cent respectively.

Service Bulletin N° 81-001 Vol. 5, N° 7 gives a more detailed analysis of performing arts organizations. Further information may be obtained by contacting the author, Mr. R. Cloutier, Education, Science and Culture Division, Statistics Canada, Ottawa K1A 0T6, (613-995-9682).

Canadian Statistical Review

Data in this publication were retrieved from CANSIM® (Registered Trade Mark of Statistics Canada for its Canadian Socio-Economic Information Management System), and processed to create a photo-ready copy from which this publication was produced. CANSIM is the Statistics Canada computerized data bank; series published in this Review (as well as other data) are available on computer printouts, cards, tape or directly via terminal.

The identification numbers at the top of each column of data refer to the unadjusted and seasonally adjusted monthly or quarterly data in this column. Series maintained by Statistics Canada carry a "D" prefix (e.g. D 1375). The "B" prefix (e.g. B 1437) identifies series in CANSIM which are maintained by the Bank of Canada.

More details on which data is available can be found in the following:

CANSIM Summary Reference Index (Annual with periodic amendments) – Free on request.

This index is a summary of the data in CANSIM. It provides a key to the Series Directory and is the first step in locating and ordering series from the CANSIM Main Base.

CANSIM Main Base Series Directory (Annual with periodic amendments) – $30.

This Directory is a detailed guide to the data on the CANSIM Main Base. It gives the title, start date, source of the data, and other descriptive material. The Directory is published in three volumes.

CANSIM Mini Base Series Directory (Annual with periodic amendments) – $10.

This Directory is a detailed guide to the data on the CANSIM Mini Base – a standard subset of data originating from the CANSIM Main Base which is available at various Secondary Distributors.

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used in Statistics Canada is the U.S. Bureau of the Census Method II, X-11 variant. Seasonal adjustment removes the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing.

While seasonal adjustment allows a much better look at the underlying trend of a series, the adjusted series will contain irregular fluctuations. Small changes between months in the adjusted series may simply be erratic movements and, to obtain a clearer idea of the underlying trend, users should examine the adjusted series over a number of months. The MCD, or Months for Cyclical Dominance, in a table containing seasonally adjusted series, indicates the smallest span of months for which the average percent change without regard to sign in the trend cycle is greater than that in the irregular factor. For the smoothest series in MCD it is 1, for the most erratic series it is 6. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.

Editorial Board

This publication is produced under the guidance of the Canadian Statistical Review Editorial Board, composed of the following Statistics Canada staff members:

G. Leclerc (Chairman) – Assistant Chief Statistician, Economic Accounts and Integration Field
V. Berlinguette – Assistant Chief Statistician, Business Statistics Field
R.E. Drover – Director, User Advisory Services Division
F. Emmerson – Co-ordinator, Financial Statistics
B.J. Lynch – Director, Prices Division
R. Platek – Director, Household Surveys Development Division
J.R. Podoluk – Director General, Household Statistics Branch
J. Randall – Director, Financial Flows and Multinational Enterprises Division
L.O. Stone – Senior Advisor, Population Studies and Statistics, Census
P.N. Triandafillou – Director, Current Economic Analysis Division
J.S. Wells – Director General, System of National Accounts (Current) Branch
M. Wisenthal – Director General, Institutional and Public Finance Statistics Branch
G. Bériault-Prud'homme – Editor, Canadian Statistical Review

Inquiries about the contents of the Canadian Statistical Review should be directed to the editor at : Current Economic Analysis Division, 23rd. Floor, Section O, R.H. Coats Bldg., Tunney's Pasture, Ottawa, Ontario, K1A 0T6.

Subscriptions

The *Canadian Statistical Review* and other catalogued publications of Statistics Canada, including a free annotated catalogue of current publications, may be ordered from Publications Distribution, Statistics Canada, Ottawa, K1A 0T6 and remittances made payable to the Receiver General for Canada.

A weekly supplement containing data published between release dates of this review is distributed free of charge to all subscribers.

Historical data for selected economic indicators, both adjusted and unadjusted for seasonal variation, are distributed to subscribers in an Annual Supplemment.

Correspondence should be directed to the *Canadian Statistical Review,* Current Economic Analysis Division, Statistics Canada, R.H. Coats Tower, Ottawa, Ontario, K1A 0T6.

Note to Users

This section is used to announce changes in tables of the *Canadian Statistical Review* and in related CANSIM series.

Section 5, Table 1 – Industry Selling Price Indexes

With this issue the 1975 annual figures are not available. They will be re-introduced when their recalculation is released by the source.

Section 5, Table 3 – Other Price Indexes

The non-residential building materials indexes within this table have been rebased to 1971 = 100, from 1961 = 100. Series on the 1961 base will continue to be available from CANSIM although they will not be updated and the series on the 1971 base can be found under the new CANSIM numbers listed.

National Income and Expenditure Accounts

Third Quarter 1976 — Advance Information

Gross National Product, seasonally adjusted at annual rates, increased 2.0 per cent to a level of $187.0 billion in the third quarter; after adjustment for price changes, real GNP grew 0.8 per cent. The real growth resulted from a modest accumulation of inventories and from increases in personal expenditure, the balance of trade in goods and services, and government current expenditure. Real gross fixed capital formation declined in the third quarter, as did real expenditure on imports. The net effect of these changes was that real final domestic demand was unchanged from the previous quarter.

The third quarter was in many respects typical of the expansion in economic activity that has taken place over the past twelve months. The economy has averaged a quarterly rate of growth of about 1 per cent during this period, which is only slightly higher than the rate achieved in the third quarter. This rate of growth, while somewhat slow by historical standards, has been fairly broadly based and all the major expenditure aggregates, with the exception of gross fixed capital formation, are above their levels of a year ago. The expansion has been driven largely by personal expenditure and by inventory movements. The value of the physical change in inventories, which has undergone considerable fluctuation in recent quarters, shifted on balance over the past year to small accumulation from heavy liquidation in 1975, and this pattern is consistent with previous cyclical upswings.

Prices

The implicit price index for total GNP rose 1.1 per cent in the third quarter. This was the smallest percentage increase in this price index since the second quarter of 1972, but much of the deceleration was due to the distortion, in a national accounting sense, of large government retroactive wage payments made in the second quarter. Nevertheless, the year-over-year rate of inflation, as measured by the GNE implicit price index, has been 9.0 per cent, the lowest such rate in over three years.

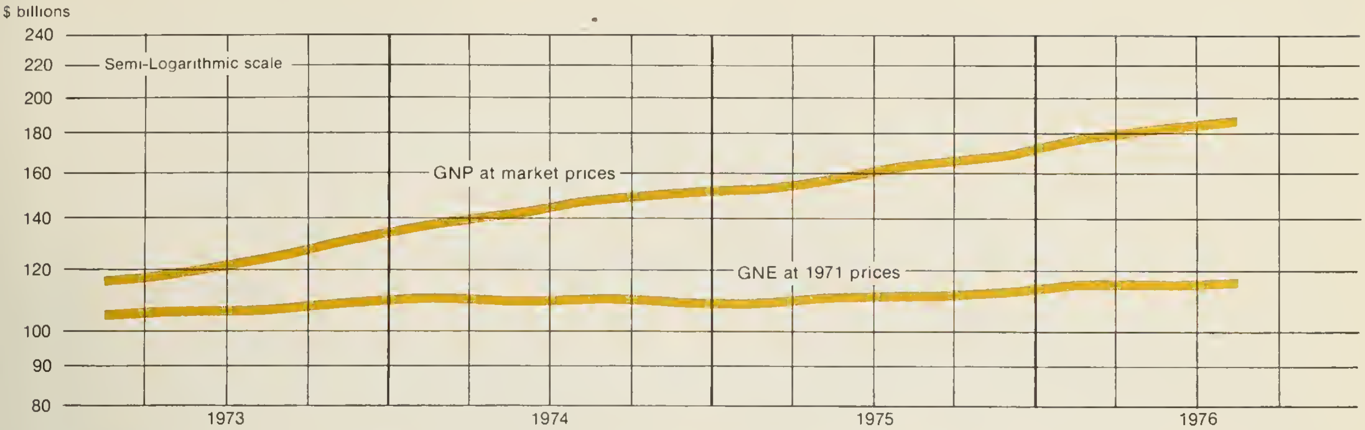
Personal Expenditures

Personal expenditure on goods and services increased 1.1 per cent in real terms in the third quarter. The strongest growth occurred in semi-durable and non-durable goods, while expenditures on services and durable goods increased only fractionally. The strength in expenditure on non-durable goods was due primarily to a large increase in real spending on food. New car sales declined from last quarter and this slowed the real growth in expenditure on durable goods.

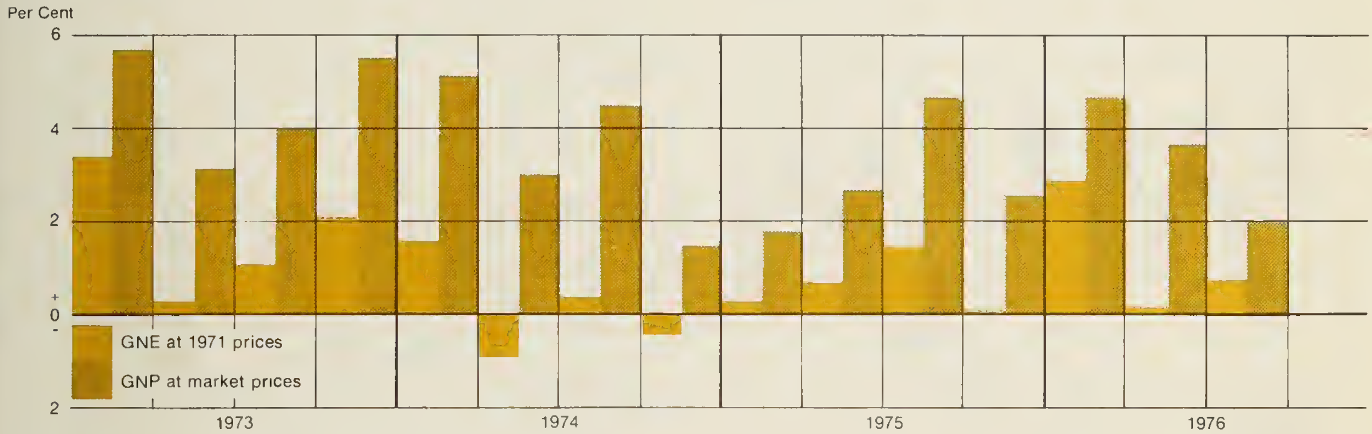
Fixed Capital Formation

Investment in fixed capital fell 4.3 per cent in real terms in the third quarter, partly as a result of industrial disputes in the construction industry. Investment in business residential construction increased marginally, as a strong increase in work put-in-place on single family dwellings was offset by declines in construction of apartments and multiples. Business non-residential construction fell 5.3 per cent and business investment in machinery and equipment declined 6.0 per cent. This left total business investment in plant and equipment about 5 per cent lower than a year ago and at a level very close to the previous trough, which was reached in the early stages of the 1974-1975 recession.

Gross National Product, seasonally adjusted at annual rates, increased 2.0% in the third quarter to a level of $187.0 billion; after adjustment for price changes, real GNP grew 0.8%.

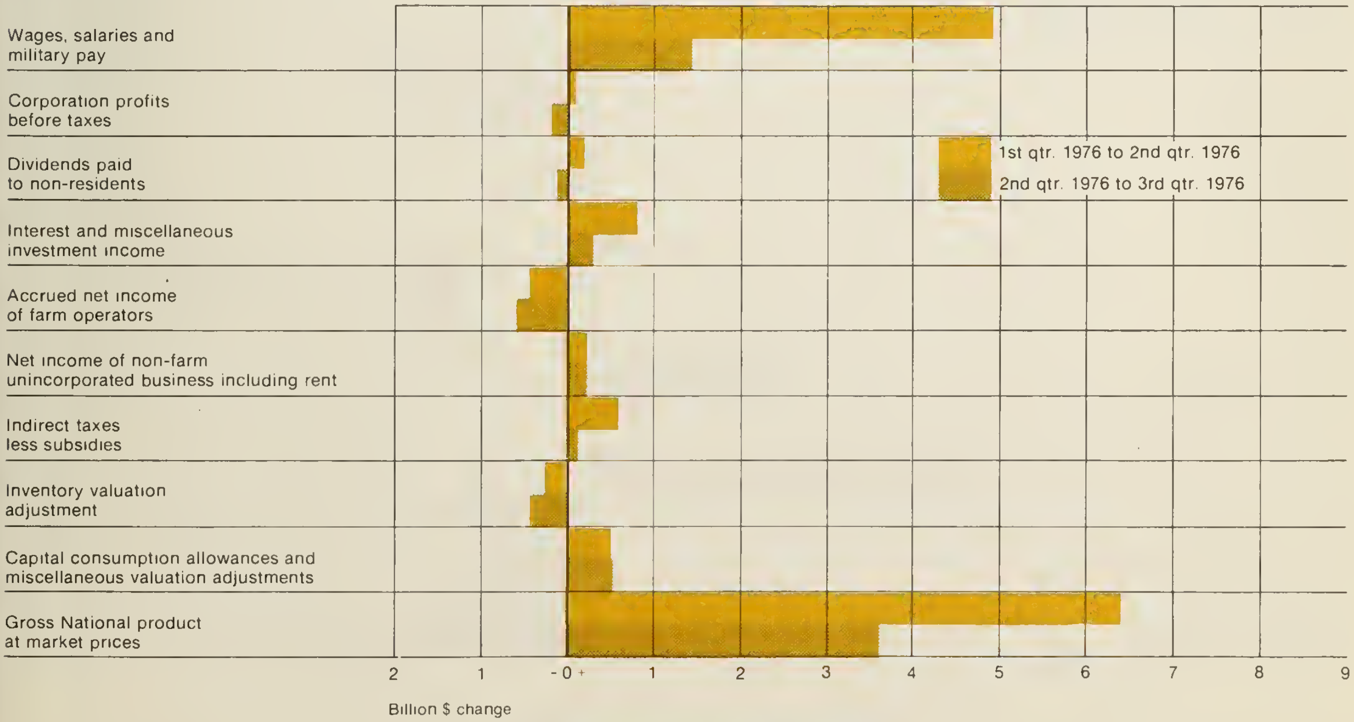


Quarter-to-Quarter Change



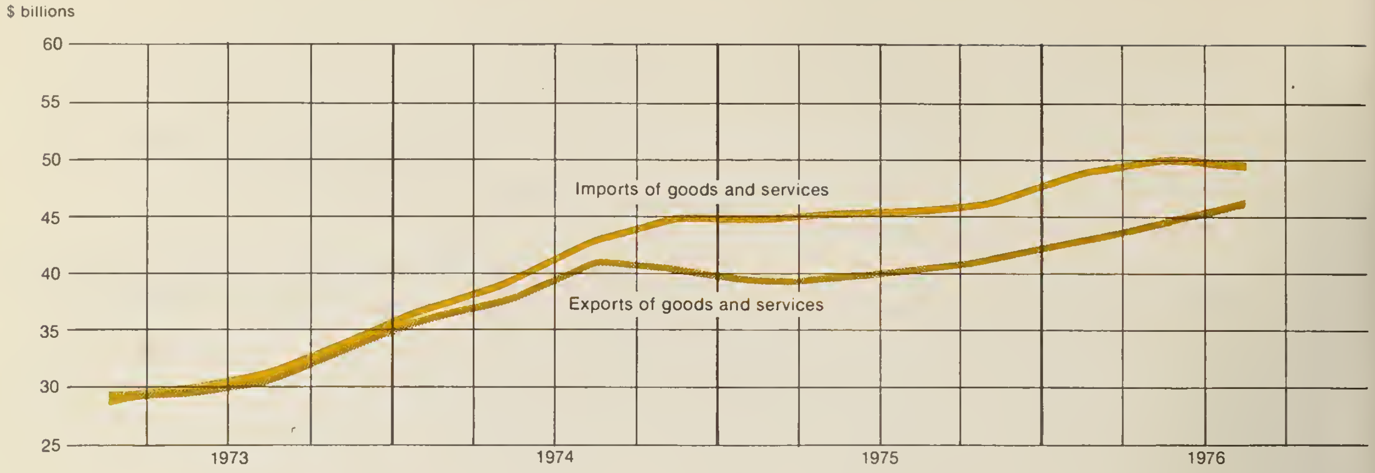
Wages, salaries and supplementary labour income rose 1.4% in the third quarter. A 1% decline in corporation profits and a 16% fall in accrued net income of farm operators combined to significantly weaken the growth of GNP.

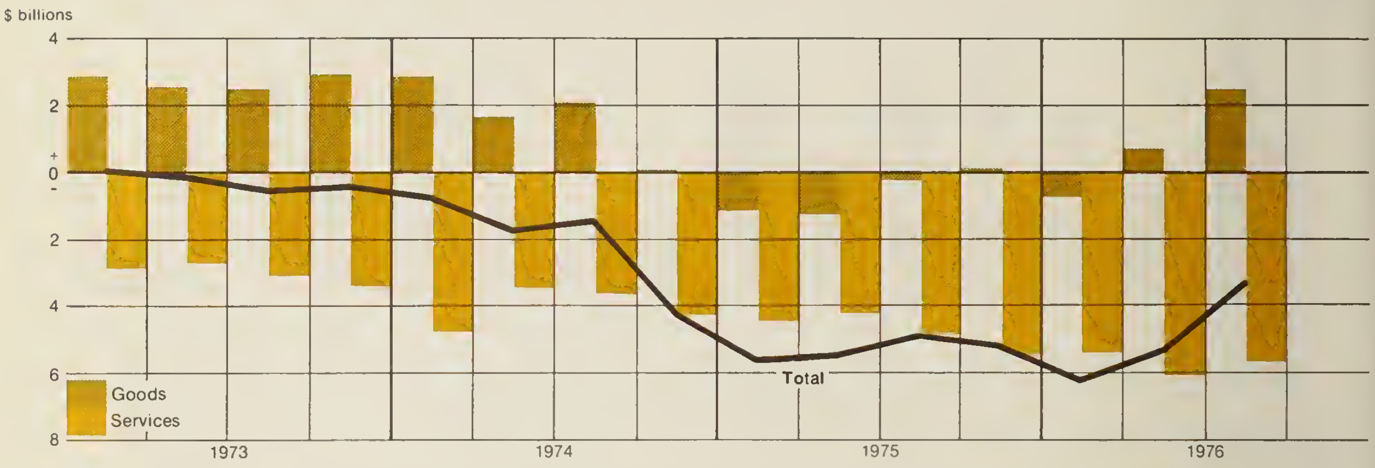
Quarterly changes in GNP and components



All quarterly data adjusted for seasonal variation and at annual rates.

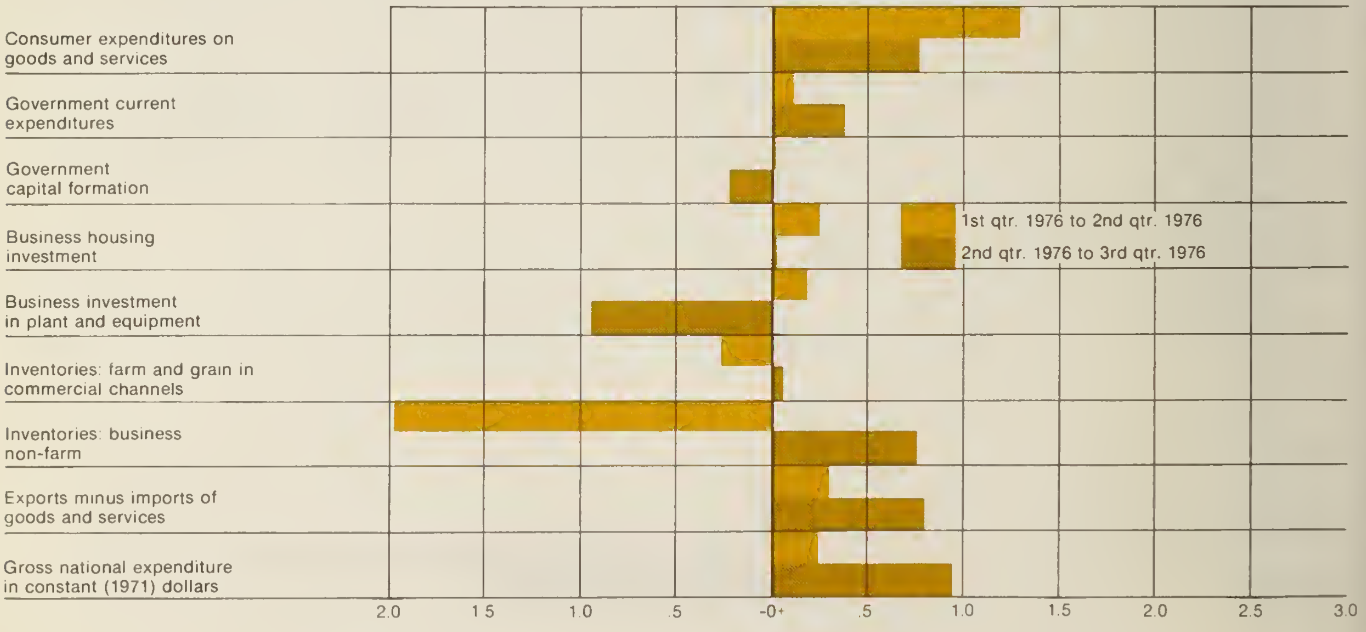
The balance of trade in goods and services improved by over $2 billion at annual rates in the third quarter, as exports grew 3.2% and imports declined 1.2%.





The modest growth in real GNE was the result of moderate inventory accumulation, increases in personal expenditure and government spending, and a reduction in the balance of trade deficit. Business gross fixed capital formation declined, while real final domestic demand was unchanged.

Quarterly changes in GNE and components in constant (1971) dollars



Billion $ change

All quarterly data adjusted for seasonal variation and at annual rates

(continued on page 143)

OBSERVATIONS

1971 Census of Canada Profile Studies

Profiles of Canada's Human and Agricultural Resources comprise a set of studies concerning selected topics from the data collected in the 1971 Census. Each profile focuses on a specific topic in the demographic, socio-economic, housing and agricultural aspects of the population. To cater to the needs of the general and of the professionally oriented readers, the studies emphasize the scientific interpretation of the results rather than mere data display.

The profile programme proposes to have 28 separate studies in three parts: Part 1 – Demographic Characteristics: includes studies relating to population growth and general demographic characteristics of the population; Part 2 – Economic Characteristics: includes studies relating to economic characteristics of the population 15 years of age and over; Part 3 – Families, Housing and Agriculture: includes studies of major trends and patterns relating to families, housing, and agriculture.

A complete list of the studies follows. Those marked with an asterisk have been published; others will be released in 1977.

Part 1: Demographic Characteristics

Catalogue no.	Title
*99-701	Population Growth in Canada (M.V. George)
*99-702	The Urban and Rural Composition of Canada's Population (J. Kralt)
*99-703	The Age-Sex Structure of Canada's Population (J.A. Norland)
99-704	Marital Status and Nuptiality in Canada (K.R. Basavarajappa)
99-705	Migration in Canada (L.O. Stone and S. Fletcher)
*99-706	Fertility in Canada (N. Collishaw)
*99-707	Language in Canada (J. Kralt)
99-708	Education Attainment in Canada (G. Tetlock and G. Mori)
99-709	Ethnic Origins of Canadians (J. Kralt)
*99-710	Canada's Religious Composition (J.K. Scott)
99-711	Place of Birth and Citizenship of Canada's Population (M.V. George)

Part 2: Economic Characteristics

Catalogue no.	Title
99-712	Labour Force Participation in Canada (H. Monck)
99-713	Unemployment in Canada (R. Khan)
99-715	The Industrial Structure of Canada's Labour Force (J. Zatko)
99-716	Industrial Trends in Canada, 1951-1971 (L. Kumar Misir)
99-718	The Occupational Composition of Canada's Labour Force (G. Montigny)
99-719	Where Canadians Work (K. Simpson and M. Cromie)
99-720	Employment Income in Canada (J.F. David)
99-721	Source and Distribution of Canadian Income (A. Rashid)

Part 3: Families, Housing, Agriculture

Catalogue no.	Title
99-723	Characteristics of Canadian Dwellings (D. Alford and J. Che)
*99-724	Occupancy Patterns and Trends in Canadian Housing (D. Alford and J. Che)
99-725	The Family in Canada (J. Veevers)
99-726	Incomes of Canadian Households and Families (R. Holmes)
99-727	The Household in Canada (B. Harrison)

*99-728	Canada's Livestock Industry (W.C. Doan)
*99-729	Large Farms in Canada (R.J. Burroughs)
99-730	Structure of Canadian Farms (R. Huang)
99-731	Socio-Economic Characteristics of Small Farm Operators in Canada (D. Lafrenière)

The price of each study is $1.00. Copies may be obtained from Publications Distribution, Statistics Canada, Ottawa K1A 0T6.

For further information regarding these studies, contact Dr. M.V. George, Census Characteristics Division, Statistics Canada, Ottawa, Ontario. (613-994-9009).

Occupational Classification

Two occupational tables have been prepared by Standards Division: they show how 1971 Census occupational data and other statistics based on the 1971 Canadian Occupational Classification Manual (OCM) may be aggregated onto the 1968 International Standard Classification of Occupations (ISCO) base, at the major group level. These tables will be particularly welcomed by researchers wishing to compare Canadian statistics with those of other countries.

Readers interested in obtaining these tables should contact the Census Data Dissemination Division, Statistics Canada, Ottawa K1A 0T6, (613-996-5254) or the Occupational Classification Section, Standards Division, Statistics Canada, Ottawa K1A 0T6, (613-996-7825).

New Catalogue

The 1976-77 edition of the Statistics Canada *Catalogue* is now available; it offers a listing of all publications available from the bureau and their prices.

New features of this edition include a special listing of non-census publications containing urban data and a list of public libraries which have all Statistics Canada publications available for reference. Part II of the *Catalogue* provides information about unpublished data and offers a list of selected statistical publications issued by other federal government departments and agencies; both sections have been enlarged.

Free copies, in either English (Catalogue 11-204E) or French (Catalogue 11-204F), are available from Publications Distribution, Statistics Canada, Ottawa, K1A 0T6.

---

[1] The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. [2] Includes logging, fishing, trapping and hunting. [3] Includes mechanical and construction. [4] Includes a small number in non-specified occupations. [5] Does not include students entering Canada on students' visas. [6] Includes also retired persons, elderly dependents, fianc!s or fianc!es and other unspecified persons not intending to enter the labour force.

[1] Figures for the year ending and quarters of 1974 represent the actual number of events reported by the provinces. Figures for the quarters beginning 1975 represent registrations filed at the provincial Vital Statistics Offices during the period under review and could differ from the final figures. The figures for Yukon and Northwest Territories for the quarters in the year 1975 are estimates.

Section 3 · System of National Accounts

1. Income and Expenditure Accounts

28 1.1 National Income and Gross National Product
28 1.2 Gross National Expenditure, Current Dollars
29 1.3 Gross National Expenditure, Constant Dollars
29 1.4 Sources of Personal Income
30 1.5 Disposition of Personal Income
30 1.6 Sources and Disposition of Gross Savings
31 1.7 Government Revenue, Expenditure, and Surplus of Deficit, by Level of Government
35 1.8 Implicit Price Indexes
35 1.9 Relation between Gross National Product at Market Prices and Gross Domestic Product at Factor Cost

2. Domestic Product by Industry

36 2.1 Real Domestic Product by Industry of Origin, Quarterly
37 2.2 Real Domestic Product by Industry of Origin, Monthly

3. Balance of International Payments

42 3.1 Canadian Balance of International Payments, Current Account, All Countries
42 3.2 Canadian Balance of International Payments, Current Account, Country Distribution
43 3.3 Canadian Balance of International Payments, Capital Account, All Countries

1–Income and expenditure accounts

---

[1] Excludes profits (net of losses) of government business enterprises. [2] Includes the withholding tax applicable to this item. [3] Includes profits (net of losses) of government business enterprises and interest and miscellaneous investment income of government. [4] Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventones. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. [5] Includes net income of independent professional practitioners. [6] See footnote 4, Table 1.2.

---

[1] Includes defence expenditures. [2] Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. [3] Includes capital expenditures by private and government business enterpnses, private non-commercial institutions and outlays on new residential construction by individuals and business investors. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. [4] The book value of inventories is deflated to remove the effect of price change and the denved "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment, (as shown in Table 1.1). [5] See footnote 4, Table 1.1.

---

[1] The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change

---

[1] This item differs from column 6, table 1.1 by excluding the adjustment which has been made to take account of the accrued earnings arising out of the operations of the Canadian Wheat Board and the Canadian Co-Operative Wheat Producers. [2] Includes all interest on the public debt paid by government to persons. [3] Charitable contributions and bad debts.

For source see Table 1.9.

---

[1] Includes the taxes on life insurance companies introduced in 1969. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals in so far as their investment activities are concerned. The 1969 taxes are thus included here pending a complete review of the treatment of insurance. [2] Excludes the special refundable tax on corporations introduced in May 1966. Refunding of the tax began in 1968. [3] Withholding taxes. [4] The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four. Since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series.

For source see Table 1.9.

---

[1] These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change.

For source see Table 1.9.

---

[1] The labour force as a percentage of the population 15 years of age and over. The participation rate for a particular group (age, sex etc.) is the labour force in that group expressed as a percentage of the population for that group. [2] The unemployed as a percentage of the labour force. The unemployment rate for a particular group (age, sex etc.) is the unemployed in that group expressed as a percentage of the labour force for that group. Seasonally-adjusted rates are calculated by dividing seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and seasonally-adjusted unemployment (i e. seasonally-adjusted labour force by summation).

Note: Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. For other explanatory material see notes at the end of Catalogue No. 71-001.

---

[1] Persons who have applied for or are in receipt of unemployment insurance benefit at the end of the month. [2] Annual figures are averages of 12 months. [3] Includes adjustments for cancellation of warrants and collection of overpayments. [4] Trainees under the Adult Occupation Training Act receiving U.I. benefit, prior to July 1975 included with regular benefit.

[1] Vacancies for full-time, casual, part-time, seasonal and temporary jobs which were immediately available. [2] Includes Prince Edward Island and the Yukon and Northwest Territories for which separate reliable estimates are not available. [3] Due to postal strike the mail sample was reduced. These estimates should be used with caution due to their reduced reliability.

---

[1] A vacancy rate is obtained by expressing the number of vacancies per thousand existing jobs (sum of vacant and filled jobs) in all industries, except agriculture, fishing and trapping, domestic service and the non-civilian component of public administration and defence. Both full-time and part-time jobs are included. [2] Includes Prince Edward Island and the Yukon and Northwest Territories for which separate reliable estimates are not available. [3] Due to postal strike the mail sample was reduced. These estimates should be used with caution due to their reduced reliability.

[1] In calculating time lost, only the workers directly affected by the strike or lockout are taken into account: time lost by workers indirectly affected, such as those laid off as a result of a work stoppage, is not included. [2] The industry groups prior to January 1973 are based on the 1960 Standard Industrial Classification. From January 1973 forward, the 1970 S.I.C. is used. [3] The number of man-days is calculated by multiplying the number of workers involved in a work-stoppage by the number of normal working days during the stoppage. Adjustments are made for establishments on shift work, etc. [4] The statistics for individual industries exclude strikes and lockouts involving fewer than 100 workers; however, the total includes all work stoppages. The agriculture, finance, insurance and real estate and public administration and defence industries are not shown separately. Should strikes occur in these industries, the time lost also will be shown in the total. In addition, the total is revised quarterly whereas the individual categories are revised annually. [5] Includes miscellaneous manufacturing industries. [6] Includes publishing and allied industries. [7] Includes storage and communication industries.

[1] The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. [2] Excludes agriculture, fishing and trapping, education and related services, health and welfare services, religious organizations, private households, public administration and defence. [3] Includes storage, electric power, gas and water utilities. [4] Excludes domestic service.

[1] See footnote 1 and source in Table 10. [2] Employment indexes in total manufacturing and in its total durable and non-durable components are given in Table 9. [3] In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. [4] Except machinery and transportation equipment industries.

[1] The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. [2] In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing

---

[1] These rounded weights, provided as a general guide, show the relative importance of the major components of the C.P.I., on average, during the year 1974. [2] Includes shelter and household operation. Until April 1973, the shelter element of regional cities' housing indexes moved on the basis of changes in rents only. However, from May 1973 on home-ownership has been included in the shelter element of regional cities' housing indexes, so that the Canada and regional cities' shelter indexes now contain the same elements.

---

[1] Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments, for these a monthly estimate of work put in place has been substituted [2] Total new orders received during the period at estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. [3] Total manufacturing inventory owned by manufacturers including warehouse stocks.

[1] Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been estimated.

[1] Starting with January 1968, production is manufacturers' production; prior to that date production was indicated by the use of excise duty stamps. [2] Intended for cigarettes. [3] Includes pipe, plug, chewing, twist, snuff etc. [4] Includes sales to wholesalers or retailers. [5] Subject to Excise Tax. [6] Includes sales for ships' stores and for export. [7] End of period.

[1] Data compiled according to the Steel Distribution Index revised January, 1964 Figures on net shipments relate to semi finished and rolled steels products only Shipments to consuming industries of castings, forgings and steel pipe are not included [2] Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities [3] Includes appliances and utensils [4] Excluding shipments for re-processing at maker's own plant.

---

[1] Production plus imports less re-exports, minus exports. [2] Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and distributors) was based on "actual cost to purchaser" rather than the suggested list price as in the past.

Sources: Motor Vehicle Shipments (42-002), New Motor Vehicle Sales (63-007), Trade of Canada, Imports (65-007), Exports (65-004), Statistics Canada.

[1] Gas types are included. [2] Includes producers' shipments for export. [3] In some cases these shipments are not at the factory level, and stocks at beginning of month plus production less shipments do not equal stocks at end of month. [4] End of period [5] Electric and other. [6] Excludes apartment type machines. [7] Excludes other than electric. **Sources: Domestic Refrigerators and Freezers (43-001), Domestic Washing Machines and Clothes Dryers (43-002), Trade of Canada, Exports (65-004), Imports (65-007), Statistics Canada.**

---

[1] Less imports. [2] Total net generation less next exports.

Note: Monthly data includes all producers of electric energy who generate 20 GW.h or more per year. Annual data may included revisions not available on a monthly basis.

Note: Components may not add to totals due to rounding. Current figures in this table are preliminary and therefore subject to revision. [1] Supply and disposition for both Crude Oil and Natural Gas will not agree because of losses, inventory changes, pipeline fuel used etc. [2] Includes crude oil, condensate and pentanes plus. [3] Gross new production by field less field flared and waste.

[1]Barrels of 35 Canadian gallons [2]Includes domestic and imported crude oil, condensate and pentanes plus received by Canadian refineries. [3]Refinery production (from crude oil, condensate and pentanes plus, and commingled propane/butane mixes) plus other materials used. [4]Includes deliveries of butane commingled in the crude stream in Saskatchewan and Alberta. [5]Includes inventories at end of period being held at gas plants and in storage caverns. [6]Includes stove oil, kerosene. [7]Includes aviation gasoline and aviation turbo fuel. [8]Due to conceptual changes, the stock and sales series are not available on a comparable basis prior to June 1965. Includes propane and propane mixes and butane and butane mixes. [9]Includes petro-chemical feed stocks, naphtha specialties, coke, lubricating oil and grease, still gas and other products.

---

[1] A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly.

Note: Components may not add to totals due to rounding differences. [1] Data are on a gross basis i.e. they do not take account of cancellations or alterations of loans after initial approval. [2] Agency loans (loans made by other lending institutions on behalf of C.M.H.C.) are included under C.M.H.C. [3] Includes fraternal and mutual benefit societies, Quebec savings banks and, since May 1967, chartered banks. [4] Includes new and existing commercial structures and farm property.

---

[1] In this context, "softwood" refers to wood from coniferous trees, and hardwood to wood from broadleafed species. [2] Includes export shipments; the softwood lumber column includes estimates for Manitoba, Newfoundland and P.E.I. [3] Shipments by principal manufacturers. Total domestic shipments are somewhat higher. [4] Production for these items. As reported by principal manufacturers. Total production is somewhat higher. [5] Building contractors, public and utility construction and structural steel fabricators.

[1] Cash receipts from farming operations excluding supplementary payments. Excludes Newfoundland [2] Represents participation payments made by the Canadian Wheat Board direct to producers on crops delivered in previous years. [3] Includes rye, flaxseed, rapeseed, soybeans and corn. [4] Includes clover and grass seed, hay, clover, greenhouse, mustard seed, sunflower seed, hops, dry beans and dry peas and miscellaneous products [5] Made under the authority of the Agricultural Stabilization Act.

Note: Components may not add to totals due to rounding. [1] The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when the current annual totals for all firms are known the following year. [2] The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers.

---

[1] Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of output. Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. [2] 1973 and 1974 price indexes are subject to revision. [3] 1974 price indexes are subject to revision. [4] Farm share only of motor vehicles [5] In addition to the components listed, the major group includes Building Repairs, Fencing Construction and Repairs, Mortgage Credit, and Farm Rent [6] In addition to components listed, the major group includes Seed, Custom Work, Artificial Insemination, Small Tools and Supplies, and Electricity

[1] Since January 1975 total milk production has been obtained by adding sales off farms to first receivers (usually marketing boards) and volume used on farms for feeding and farm house consumed. [2] Includes case and bulk. [3] As at end of period. Last month is preliminary. [4] Exclusive of Newfoundland; includes hatching eggs.

[1] Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada. Data shown for the last current year are not so adjusted. [2] Production is calculated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. [3] Includes baking and frying oils and fats. [4] Includes stocks held by manufacturers and other warehouses. [5] Includes fresh sausage, frankfurters, weiners and all other sausage. [6] Includes solid, coated, bulk, packages and novelties. [7] The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of 1970, be collected on the basis of factory sales.

Note: Components may not add to totals due to rounding and partial revisions. [1] Fully secured by marketable bonds and stocks. Excludes loans to finance the purchase of Canada Savings Bonds. [2] Includes loans on the security of household property. [3] Not available on a monthly basis. [4] Includes loans to finance companies which are affiliates of retail merchandisers. [5] Religious, educational, health and welfare institutions. [6] Differs from general loans in Section 13, Table 2 by the exclusion of loans to instalment finance companies.

Note: Components may not add to totals because of rounding.

[1] Credit extended mainly to individuals and chiefly for personal consumption expenditures. Data exclude consumer indebtedness arising from residential mortgages, home-improvement loans and bank loans fully secured against marketable securities. Figures do not include statistics on interpersonal loans, bills owing to doctors, dentists, lawyers, and other personal service credit. [2] Conditional sales agreements held by sales finance companies and by consumer loan companies in connection with the financing of retail purchases of consumers' goods and repaid in instalments. Amounts shown exclude unearned finance charges. [3] Personal cash loans of up to $1,500 made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. [4] Personal cash loans over $1,500, usually repaid in instalments. Amounts shown exclude unearned finance charges. [5] Includes bank-sponsored credit card balances. [6] The data for Quebec savings bank loans are not seasonally adjusted as no seasonality is present: this series is repeated in the unadjusted form. [7] Amount owed by personal (non-commercial) credit card holders to oil companies, airlines, auto-rental firms, and international travel and entertainment credit card issuing companies. [8] Bills due for non-commercial use of telephones, gas and electric power. [9] Personal cash loans only. The data for mortgage end trust companies are not seasonally adjusted because there are not yet enough data to determine a pattern of seasonality: this series is repeated in the unadjusted form.

---

[1] Column numbers refer to tables 3 and 4 section 11. [2] Includes special transaction-trade, not shown separately. [3] The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. [4] Revisions made to ensure consistent coverage. The most important are: Farm machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc.

Source: Trade of Canada, Exports (65-004), Statistics Canada.

Table 4: Merchandise imports, by commodity, based on the standard commodity classification[1] (million dollars)

---

[1] Column numbers refer to tables 3 and 4, section 11. [2] The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. [3] Includes special transaction-trade, not shown separately. [4] Includes scrap. [5] Some series such as General purpose machinery have been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) now include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. **Source: Trade of Canada Imports (65-007), Statistics Canada.**

[1] Data for 1970 through 1972 refer to 24 class 1 and 2 carriers whose gross annual revenues totalled $500,000 or more. Commencing January 1973, only 6 major railways (accounting for 95 per cent or more of the total operating revenues) are shown.

[1] Beginning with 1970, figures include the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Transair) normally account for approximately 85 per cent of the total revenues and expenses reported by Canadian commercial air carriers. [2] Cargo includes air freight and express but excludes mail and excess baggage.

[1] Bank of Canada deposits are averages of the juridical days in the month shown while Bank of Canada notes and Canadian dollar deposit liabilities are averages of the 4 consecutive Wednesdays ending with the second last Wednesday in the previous month. [2] Daily averages for period. [3] Mainly deposits of foreign banks. [4] Capital, rest fund and undivided profits as at the latest fiscal year-end. [5] Including issues payable in foreign currency. [6] Excluding Canadian day-to-day loans. [7] Securities purchased direct from issuer with a term of less than one year at time of issue are classified as loans. [8] Loans to grain dealers and exporters. [9] Loans to finance purchase of Canada Savings Bonds at time of issue. [10] Including loans to instalment finance companies. [11] These series reflect the combination of two CANSIM series.

Note: Components may not add to totals because rounding. [1] This series was designed to cover 50 clearing house centres. With the advent of centralized data processing, bank clearing houses have been eliminated. The current allocation of cheques cashed continues to reflect what had been the previous centres; however, this comparison may not remain valid through time. Discussions are underway in an attempt to establish boundaries which would be more precisely defined. [2] Seasonally adjusted data for Saskatchewan have been deleted because current data could not be satisfactorily adjusted.

[1] Excluding revivals, increases, dividend additions, reinsurance acquired, credit insurance and pension bonds without insurance. Value totals are estimates projected from the sales reported by companies operating in Canada representing over 80% of new ordinary and of new group contracts. [2] Total new settled-for ordinary sales in Canada. [3] Total sales figure does not include sales for Northwest Territories. [4] Under new or amended contracts.

Note: Components may not add to totals due to partial revisions.

[1] End of period. [2] Excluding Treasury Bills, Canada Savings Bonds and other non-market issues. [3] Figures are subject to revision. Series cover all publicly announced issues and some private placements not publicly announced. Notes with an original term to maturity of over one year. [4] Includes Canadian Pension Plan series bonds issued by the provinces and their agencies and purchased by the C.P.P. Investment Fund. [5] Consists of issues of Canadian religious and other institutions and Canadian dollar issues of foreign debtors. [6] Allowance for the take-over of Nova Scotia Light & Power common shares.

---

[1] The number of stocks included has varied over the period; the totals shown in the column headings represent the current coverage. [2] The headings for "base metals" and "industrial mines" are not found in the Standard Industrial Classification. [3] Combines the industrials, utilities and finance common stocks. [4] Stocks included in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. [5] Includes also the machinery industries (except electrical machinery) and the transportation equipment industries. [6] Stocks included in the mining index are for producing mines.

---

[1] This statement includes only receipts relating to budgetary revenue. Excluded are non-budgetary revenues such as Old Age Security Fund taxes, Prairie Farm Assistance Act levies, employer and employee contributions to government-held funds (Unemployment Insurance, Superannuation etc.), interest on government-held funds, and taxes collected on behalf of and transferred to other governments. [2] Beginning in December 1973, this category includes oil export tax. [3] March includes supplementary payments arising from the closing of the accounts. **Sources: The Canada Gazette and Dept. of Finance.**

(continued from page 8)

Inventory Investment

After extremely heavy accumulation in the first quarter and substantial liquidation in the second, the value of the physical change in inventories swung to a moderate $344 million accumulation in the third. Some liquidation of farm stocks was offset by stockbuilding in non-farm industries, particularly manufacturing.

The External Sector

The balance of trade in goods and services improved by over $2 billion in current dollars in the third quarter, as exports grew 3.2 per cent and imports declined 1.2 per cent. There were large increases in exports of lumber, wood pulp, newsprint and fertilizers, but a decline in exports of motor vehicles and parts. The decline in imports was almost entirely the result of a substantial fall in crude petroleum imports, probably reflecting the opening of the Sarnia-Montreal pipeline.

Incomes

Wages, salaries and supplementary labour income rose 1.4 per cent in the third quarter, and with rises in transfer payments to persons and in interest, dividends and miscellaneous investment income, this resulted in a 1.8 per cent increase in total personal income. As there was a large increase in personal income tax collections, however, personal disposable income fell.

Corporation profits before taxes remained weak in the third quarter, preliminary estimates indicating a decline of about 1.0 per cent. There was also a large drop in the accrued net income of farm operators from farm production, which significantly weakened total GNP.

Note:

Users are reminded that, due to statistical difficulties arising out of structural and price changes in the economy, larger than normal revisions were made at the time the first quarter estimates were prepared. Difficulties with some component series have persisted and further revisions to current preliminary data may be necessary. These revisions will be revisions to levels; it is not now anticipated that present movements in most component series will be altered significantly. Users should keep this caution in mind when using these estimates. For further details and guidance in the problem areas see *National Income and Expenditure Accounts, Second Quarter, 1976* (Catalogue 13-001).

---

[1] Excludes profits of government business enterprises.

[2] Includes the withholding tax applicable to this item.

[3] Includes profits (net of losses) of government business enterprises and other government investment income.

[4] Includes an arbitrary smoothing of crop production, and standard seasonal adjustment for withdrawals of grain from farm stocks and for the changes in farm- livestock and other inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures of accrued net inc of farm operators.

[5] Includes net income of independent professional practitioners.

[6] See footnote 4, Table 2.

udes defence expenditures. Details are shown in line 45, Table 16 of the forthcoming publication *National Income and Expenditure Accounts, Third Quarter* logue 13-001).

udes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence ruction and equipment which are defined as current expenditure.

udes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by duals. Capital expenditure is defined to include all transfer costs on the sales and purchases of the existing land and buildings.

book value of inventories is deflated to remove the effect of price changes and the derived "physical" change is then valued at average prices of the current d to obtain the value of physical change. The difference between this value of physical change and the change in book value is called the inventory valuation tment. (See line 8, Table 1.)

he seasonally adjusted series, the value of grain crop production in each quarter is taken as one fourth of the estimated value of crop production for the year whole (see footnote 4, Table 1). All other items in the farm inventories series are seasonally adjusted by standard techniques.

Table 3. Gross National Expenditure in Constant (1971) Dollars, by Quarters, 1975 and 1976

Seasonally adjusted at annual rates[1]

	1975					1976		
	I	II	III	IV	Year	I	II	II
	millions of dollars							
Personal expenditure on consumer goods and services	67,700	68,656	70,572	71,444	69,593	72,148	73,460	74,
Durable goods	10,952	11,368	12,440	12,872	11,908	11,948	12,604	12,
Semi-durable goods	9,636	9,896	10,384	10,440	10,089	10,636	10,796	10,
Non-durable goods	20,408	20,588	20,600	21,144	20,685	21,768	22,060	22,
Services	26,704	26,804	27,148	26,988	26,911	27,796	28,000	28,
Government current expenditure on goods and services	21,412	21,892	22,340	21,596	21,810	22,160	22,268	22,

(of which: Merchandise)	-21,732	-21,792	-21,400	-21,988	-21,728	-23,356	-23,484	-23.
Residual error of estimate	584	-200	-372	-236	-56	-584	-288	-
Gross National Expenditure in 1971 dollars[1]	109,532	110,272	111,968	112,128	110,975	115,400	115,656	116,
Final domestic demand	113,920	116,084	119,148	119,852	117,251	120,796	122,696	122,

---

[1] The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars b constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affecte compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movemen the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price chan
